Li-ion batteries contain a protection circuit that shields the battery against abuse. This important safeguard also turns the battery off and makes it unusable if over-discharged. Slipping into sleep mode can happen when storing a Li-ion pack in a discharged state for any length of time as self-discharge would gradually deplete the remaining charge.

Identifying a Dead Battery. If your lithium-ion battery is not working, it may be dead. To identify a dead battery, use a multimeter to check the voltage. A fully charged lithium-ion battery should have a voltage of around 4.2 volts. If the voltage is significantly lower than this, it may be a sign that the battery is dead or damaged.
