Energy density is measured in watt-hours per kilogram (Wh/kg) and is the amount of energy the battery can store with respect to its mass. Power density is measured in watts per kilogram (W/kg) and is the amount of power that can be generated by the battery with respect to its mass. To draw a clearer picture, think of draining a pool.

A battery is a device that holds electrical energy in the form of chemicals. An electrochemical reaction converts stored chemical energy into electrical energy (DC). The electrochemical reaction in a battery is carried out by moving electrons from one material to another (called electrodes) using an electric current.

Batteries give electric power to flashlights, radios, cell phones, handheld games, and many other types of equipment. A battery is a sort of container that stores energy until it is needed. Chemicals inside the battery store the energy. When the battery ...
