

How many kWp does a solar tree have?

Deep, Mishra and Agarwal [15] built a full-size tree in New Delhi, India (latitude 28° N). They used a metal frame and five 1 kWp crystalline silicon panels, totaling 5 kWp. Each panel was 1.65 × 1.00 m. Shanmukhi et al. [19] and Dey and Pesala [18] simulated real-scale solar trees with a power of 3 kWp and heights ranging from 4 to 5 meters.

What are solar trees & how do they work?

Solar trees are a decorative (or antiquated) means for producing renewable electricity; most often, solar trees embody a steel structure (Berny et al., 2015). The modules are arranged in layers or in symmetrical or random shapes to absorb the enormous amount of solar PV energy to generate electricity.

How big is a solar tree?

The solar tree developed by [26], in Medellín, Colombia (latitude 6.217° N), was 3.5 m high, with four acrylic leaves that supported the four photovoltaic panels, as shown in Figure 5. Each panel was 54 × 83.2 cm and 50 Wp.

Is Solar Tree Technology a good energy conversion method?

Analyzed studies show that solar tree technology is a good energy conversion method as it needs only 1% land compared with traditional PV systems to produce power as much as 10%. Besides, this technology could efficiently collect off-peak sunshine and reflect light, and thus, create greater solar fraction.

Are solar trees optimized for solar energy generation?

Since all the studied solar trees in the literature did not have more than 12 leaves, they may represent an indication that those trees presented were not optimized regarding the generation of electrical energy per total area used.
