While natural sunlight provides vitamin D, which plays a role in immune function and bone health, it's not a primary cancer treatment. Some studies suggest a potential link between vitamin D and reduced cancer risk, but this isn't a substitute for established cancer treatments. Excessive sun exposure can increase skin cancer risk. Cancer treatment requires evidence-based medical approaches. Consult oncologists for comprehensive and safe cancer management, and discuss vitamin D levels for overall health.

Is solar a good source of energy?

Solar is the most abundant, fastest, and cheapest energy source on Earth, and it generates minimal greenhouse gas emissions. Although this renewable energy is rapidly growing across the globe, with an increasing number of countries investing in it, there are some factors that could hinder its growth.

Why is solar energy important?

Solar energy creates free, renewable power from the sun. It's abundant and produces no carbon emissions or local air pollution. Still, about 60% of the electricity that power plants generate in the U.S. comes from fossil fuels like coal and natural gas, which we know contribute to issues related to global warming and climate change.

Could solar energy save money?

It could also drive down costs. Already, solar panels themselves account for less than half the cost of large solar farms and a tiny fraction of the cost of small rooftop projects,⁷ so lightweight technologies that save on labor, transportation, and land use costs could make solar energy even cheaper and more accessible.
