

Alien spaceship in our solar system

There is a very large scientific leap from observing a fireball to claiming it as an alien spaceship. ... We know meteors from our Solar System contain iron and nickel, echoing the relative ...

But most scientists think the idea that we spotted alien technology in our solar system is a long shot. In 2018, our solar system ran into an object lost in interstellar space. The object, dubbed ...

With next-generation telescopes, tiny space probes, and more, scientists aim to search for life beyond our solar system--and make contact. Propelled to a fifth the speed of light by a laser beam ...

"Oumuamua is a cigar-shaped cosmic object from outside our solar system, but its shape is atypical for a comet, and it lacks a coma, the cloud of gases that envelops comets. Furthermore, "Oumuamua was accelerating ...

Some search on the planets in our Solar System - others look much further, into deep space. As powerful as Nasa's JWST is, it has its limits. Earth's size and proximity to the Sun enable it to ...

Webb will solve mysteries in our solar system, look beyond to distant worlds around other stars, and probe the mysterious structures and origins of our universe and our place in it. Webb is an international program led by NASA with its partners, ESA (European Space Agency) and CSA (Canadian Space Agency).

"Given the rather unusual properties of the 2M1207 system, the giant planet most probably did not form like the planets in our solar system," Gaël Chauvin, an astronomer at the European Southern ...

While alien hunters spend plenty of time searching for habitable planets beyond our solar system, a study published in July in the journal Monthly Notices of the Royal Astronomical Society warns ...

On Oct. 19, 2017, a telescope in Maui detected something that had entered our solar system from elsewhere in the galaxy. Astronomers named it Oumuamua, Hawaiian for "scout" or "messenger ...

Last year, an enigmatic object named Oumuamua startled astronomers when it came streaking past the sun, giving humanity its first close-up look at an object from beyond our solar system. This year ...

The Kuiper belt contains icy comets, not rocky asteroids. Asteroids are not really made of rock. The Oort cloud has nothing to do with comets., Imagine that an alien spaceship crashed onto Earth. Which statement would most likely be true? The crash would create a noticeable crater. The aliens" home world is another planet in our own solar system.

Alien spaceship in our solar system

In the coming weeks, NASA's Europa Clipper will take off on a long journey to Jupiter's moon Europa. The icy moon could potentially host alien life -- and there's only one way to find out.

Neither did its brightness, which revealed "Oumuamua was at least 10 times more reflective than one of our solar system's typical space rocks--shiny enough to suggest the gleam of burnished ...

And that's only one of the promising bodies to look for life in our solar system. There are icy moons in the outer solar system like Saturn's moon Enceladus and Jupiter's moon Europa that look like they may have subsurface oceans that could be habitable. And that's just what's in our solar system.

An international team of researchers has finally debunked the idea that the object, roughly two times as tall as the Space Needle and the first from another star system found in our solar system, was some alien technology with a mission to explore outer space, The Sydney Morning Herald reports.

Aliens, UFOs not being hidden from public (really): New Pentagon report The report seeks to put to rest the notion that the Pentagon - or anyone else in or working for the U.S. government - is ...

And the space between our star system and our closest neighbor, Proxima Centauri, is even more vast. ... zone of the solar system. Each one a possible alien craft, if you share Loeb's open ...

In 2018, our solar system ran into an object lost in interstellar space. The object, dubbed "Oumuamua, seemed to be long and thin -- cigar-shaped -- and tumbling end over end.

The object known as 1I/2017 U1 (and nicknamed "Oumuamua) was traveling too fast (196,000 mph, that's 54 miles per second or 87.3 kilometers per second) to have originated in our solar system. Comets and asteroids from within our solar system move at a slower speed, typically an average of 12 miles per second (19 kilometers per second) . In non-technical terms, ...

The oddly shaped object that came whizzing past the Sun and Earth in 2017 on a trajectory from outside our Solar System prompted wild speculation. Most scientists think the ...

A mysterious cigar-shaped object spotted tumbling through our solar system last year may have been an alien spacecraft sent to investigate Earth, astronomers from Harvard University have suggested.

If an alien space probe wandered into our Solar System, what would it look like? Assuming anybody's actually out there, and assuming they happen to send something our way, the first alien probe ...

Its high speed--87 km per second (54 mi. per second)--and highly elliptical angle indicated that it originated from deep space, the first known interstellar object ever to enter our ...

Instead of growing an icy tail, this alien space rock looked relatively dry. It also appeared surprisingly dense

Alien spaceship in our solar system

and rocky. Its shape was even more perplexing. Most space rocks in our solar system are shaped something like a potato -- or, in the case of Arrokoth, like two of them smashed together. But "Oumuamua is long and stretched out ...

The weird asteroid Oumuamua has people wondering if it's really a space rock booted out of another solar system or an alien spaceship. ... orbit expected for an object born in our solar system. It ...

"Our technology in our own solar system has spread outside the habitable zone," Croft told Space . So technology-friendly civilization in HD 110067, if any, may have communication relays set up ...
