Bad System Config Info is a common bug check error on Windows. Learn how to fix the Bad System Config Info error in Windows 10 and 11.

What is a bad system configuration info stop code?

The Bad System Config Info stop code is a common Windows error that can cause a Blue Screen of Death (BSOD). While the system crash and blue screen can seem alarming, the Bad System Config Info error is relatively simple to fix and doesn't require much technical expertise. Better still, it doesn't take long to fix, either.

What causes a bad system config info BSOD?

One of the clearest causes of a bad system config info BSOD is, unfortunately, corrupt system files. If you're still able to load your Windows PC, the best way to check for this error is to run some system repair tools from a Windows PowerShell terminal window. To do this, right-click the Start menu and select the Windows PowerShell (Admin) option.

What is bad system configuration info error 0x74?

There are several Blue Screen of Death errors users have faced on Windows 11, and one of them is "BAD_SYSTEM_CONFIG_INFO" aka Error 0x74. According to Microsoft, it usually pertains to corrupt Registry files or damaged BCD data. So in this guide, we are sharing the best methods to fix the Bad System Config Info error in Windows 11.

How do I fix a bad system configuration info BSOD?

Use the following steps to run the DISM and SFC scans in an attempt to repair any corrupted system files that may be affecting critical system files and throwing a BSOD: Launch an elevated Command Prompt. Once done, recheck if the issue persists. If it does, there are other methods to repair Windows and mitigate the "Bad System Config Info" BSOD.

What is bad_system_config_info BSOD?

However, many people still experience a "BAD_SYSTEM_CONFIG_INFO" BSOD without a warning or any stopcodes. A "Bad System Config Info" error mostly occurs due to a critical system file either being corrupted or duplicated, and the system does not understand how to react, hence throwing a BSOD to protect the device.

i am getting a big problem in my pc after there was a power outage due an blackout last Sunday all the games on my pc have became slower and lower in things i think could have happened that something happened to the power supply due the power outage or the gpu died because it was already dying and working well My Specs:

when I try to boot my computer I get a blue screen and it goes into automatic repair mode and gives the message "bad system config info", nothing I do helps, it just reboots to the blue repair screen.

It is likely that when you restore the system image, the issue will remain, as it is an image of the system that also contains the corrupted system files. Simply copying the files should be enough. You can use the command line in WinRE, or by using the "file select" dialog from the system image recovery utilities, or by using a Linux boot disk.

It's a nuclear option, but to properly fix the System Config Info, just replacing your Windows install with a fresh one. The nice thing is, we have a few tutorials on how to do this already if you want to reinstall it via a USB Stick (it might say Windows 11, but you can simply use a Windows 10 ISO).

After a power outage, Deco reboots faster than the ISP router and starts its own DHCP server; then when the main router is fully restored, it detected there is another DHCP server and stopped assigning IP addresses. But it might need further confirmation next time you had the same issue. (You could check the IP gateway on the clients.)

Getting dump files which we need for accurate analysis of BSODs. Dump files are crash logs from BSODs. If you can get into Windows normally or through Safe Mode could you check C:\Windows\Minidump for any
