

Biological photovoltaics

What is biological photovoltaics?

Biological photovoltaics, also called biophotovoltaics or BPV, is an energy-generating technology which uses oxygenic photoautotrophic organisms, or fractions thereof, to harvest light energy and produce electrical power.

What is biological photovoltaics (BPV)?

Biological photovoltaics (BPV) is a clean energy-generating technology that uses biological photosynthetic material to capture solar energy and directly produce electrical power. BPV systems are sometimes also described as living solar panels. Take a look at the video for an introduction here.

How does a biological photovoltaic system work?

An illustration of how a biological photovoltaic system operates. Like other fuel cells, biological photovoltaic systems are divided into anodic and cathodic half-cells. Oxygenic photosynthetic biological material, such as purified photosystems or whole algal or cyanobacterial cells, are employed in the anodic half-cell.

Why are biological photovoltaic systems better than non-biological fuel cells?

Similar to microbial fuel cells, biological photovoltaic systems which employ whole organisms have the advantage over non-biological fuel cells and photovoltaic systems of being able to self-assemble and self-repair (i.e. the photosynthetic organism is able to reproduce itself).

Do biological photovoltaic systems need organic compounds?

Compared to microbial fuel cells, which use heterotrophic microorganisms, biological photovoltaic systems need no input of organic compounds to supply reducing equivalents to the system.

Can photosynthetic biofilms harness solar energy in a mediatorless bio-photovoltaic cell system?

Photosynthetic biofilms in pure culture harness solar energy in a mediatorless bio-photovoltaic cell (BPV) system. *Energy Environ. Sci.* 4,4699-4709. doi: 10.1039/C1EE01965A

Starting with the idea of making biological solar panels, which needed the team to find ways of integrating biological organisms into electrochemical systems, the research team has developed a patented bio-photovoltaic system based on algae, and a further system based on moss. ... Bio-photovoltaic cells are different from silicon solar cells in ...

This work details the construction and testing of a biological photovoltaic cell (BPV) that utilizes solar energy to generate electricity from biological photosynthetic activities of microorganisms. *Nannochloropsis Oculata*, a marine microalgae that can survive in hot climates with good photosynthetic activity is used and the potential of energy conversion is investigated ...

Biological photovoltaics (BPV) is an energy-generating technology which uses oxygenic photoautotrophic

organisms, or fractions thereof, to harvest light energy and produce electrical power. Biological photovoltaic devices are a type of biological electrochemical system, or microbial fuel cell, and are sometimes also called photo-microbial fuel ...

Most solar energy incident (>70%) upon commercial photovoltaic panels is dissipated as heat, increasing their operating temperature, and leading to significant deterioration in electrical performance.

Biological photovoltaics (BPV) is a clean energy-generating technology that uses biological photosynthetic material to capture solar energy and directly produce electrical power. BPV ...

Biophotovoltaics is a relatively new discipline in microbial fuel cell research. The basic idea is the conversion of light energy into electrical energy using photosynthetic microorganisms. The microbes will use their ...

In this review, we are summarizing the significant properties of the biological photovoltaic system and the role of cyanobacteria as a key microbial model for the energy system. The types of BPV along with its light-harvesting sources and electron transfer mechanisms are extensively discussed. The variant species of cyanobacteria have been ...

Merging Biology and Photovoltaics: How Nature Helps Sun-Catching Luca M. Cavinato, Elisa Fresta, Sara Ferrara, and Ruben D. Costa* DOI: 10.1002/aenm.202100520 ... biological, and hybrid nature that interfaces with living tissues.[47] Thus, biomaterials are not necessarily biological or based on bio-related matter. However,

The prevailing technology for solar energy utilization is photovoltaics (PV), which directly convert solar energy into electricity through photovoltaic effect of semiconductor materials. ... Quantitative analysis of the factors limiting solar power transduction by *Synechocystis* sp. PCC 6803 in biological photovoltaic devices. Energy Environ ...

tive features relative to synthetic and non-biological photovoltaics, including their environmentally friendly nature and ability to self-repair. However, efficiencies of BPVs are currently lower ...

Biological photovoltaic devices, also called photomicrobial fuel cells or living solar cells, are a kind of biological electrochemical system or microbial fuel cell. In biological photovoltaic systems using of biological organisms, electrons are transferred to the anode (anode) by decomposition of water into oxygen and hydrogen by photolysis. ...

Microbial biophotovoltaics (BPV) offers a biological solution for renewable energy production by using photosynthetic microorganisms as light absorbers. Although abiotic engineering approaches, e ...

Forward thinking: Biophotovoltaic (BPV) systems utilise oxygenic photosynthetic microorganisms associated with an anode to generate an extracellular electrical current, which is stimulated by illumination. The aim of ...

Biological photovoltaics (BPVs) are emerging systems that concurrently exploit the advantages of photovoltaics and bioelectrochemical cells to generate electricity by harvesting solar energy without relying on any exogenous supply of reducing equivalents . 17 Numerous cyanobacterial 18 and green algal 19 biofilms have been used in BPV systems ...

Algae-Powered Computing Scientists used a widespread species of blue-green algae to power a microprocessor continuously for a year -- and counting -- using nothing but ambient light and water. Their system has the potential as a reliable and renewable way to power small electronic devices. The sys

As battery waste grows to become a more severe issue, biological photovoltaics pose as a sustainable alternative to conventional batteries. This project aims to improve the design of biological ...

Scientists used a widespread species of blue-green algae to power a microprocessor continuously for a year -- and counting -- using nothing but ambient light and water. Their system has the potential as a reliable and ...

This work details the construction and testing of a biological photovoltaic cell (BPV) that utilizes solar energy to generate electricity from biological photosynthetic activities of microorganisms. *Nannochloropsis Oculata*, a marine microalgae that can survive in hot climates with good photosynthetic activity is used and the potential of energy ...

Bombelli P, Bradley RW, Scott AM, Philips AJ, McCormick AJ, Cruz SM, Anderson A, Yunus K, Bendall DS, Cameron PJ, Davies JM, Smith AG, Howe CJ, Fisher AC (2011) Quantitative analysis of the factors limiting solar power transduction by *Synechocystis* sp. PCC 6803 in biological photovoltaic devices. *Energy Environ Sci* 4:4690-4698

This project aims to further explore biological photovoltaics (BPVs)-a sustainable alternative to conventional batteries. Global battery demand is predicted to increase significantly from 555GWh in 2023 to 2035GWh in 2030, and global energy generation is predicted to increase from ~700TWh in 2023 to ~900 TWh in 2027 [1][2]. ...

The term "biological photovoltaic system" encompasses a broad range of technologies which all employ biological material that can harness light energy to split water, and then transfer the resulting electrons to an anode for power generation or electrosynthesis. The use of whole cyanobacterial cells is a good compromise between the ...

This review aims at providing an extensive description of the most relevant and recent advances in bio-based PV devices, considering the last five years as period of interest (2015-2020 and over 150 works) and the third generation PV ...

Biological photovoltaic cells can be called as living solar cells. They use oxygenic photoautotrophs such as

cyanobacteria and algae, instead of silicon, to capture light energy for photolysis. The organisms such as cyanobacteria and algae capture light energy during...

INTRODUCTION. This project aims to further explore biological photovoltaics (BPVs)-a sustainable alternative to conventional batteries. Global battery demand is predicted to increase significantly from 555GWh in 2023 to 2035GWh in 2030, and global energy generation is predicted to increase from ~700TWh in 2023 to ~900 TWh in 2027.[1][2] Currently, the energy ...

19.3.2.2 Photosynthetic at Anode with Artificial Mediators Biological Photovoltaics In these type of photosynthetic microbial fuel cell (PhFC), intracellular carbon storages are metabolized and electrons are collected at the electrode through PhFC.

Biological photovoltaics are a technology in which phototrophic organisms used photosynthesis and energy is harvested from the light [70]. Biological photovoltaic devices, which are energy conversion technologies, are termed bioelectrochemical fuel cells, microbial fuel cells, or the photo-bioelectrochemical fuel cells used recently.
