

This chapter discusses the combustible fuel and the oxidizing agent (air) as they pertain to the typical fossil fuel steam generator. The two most common types of fossil fuels utilized for electricity generation are natural gas and coal. The chapter shows the combustion equations for various types of elements contained in fossil fuels.

Energy storage systems such as power-to-gas may provide a clean and efficient way to store the overproduced electricity. In this work, a power-to-gas system coupled with a chemical looping combustion combined-cycle system is proposed to provide base and intermediate load power from the unused electricity from the grid.

The efficiency of a boiler is the ratio of heat absorbed by water and steam to the heat equivalent of the fuel fired. excess air: Air supplied for combustion in excess of theoretical combustion air. flue gas: The gaseous products of combustion in the flue to the stack. forced draft fan: A fan supplying air under pressure to the fuel-burning ...
