high-temperature hybrid compressed air energy storage system that can efficiently store grid-level energy and release that energy when it is required to meet peak demand. Combining ultra-low-cost thermal energy storage with efficient compressed air energy storage, resulted in higher-than-normal efficiency system with low cost for electricity costs.

To reduce dependence on fossil fuels, the AA-CAES system has been proposed [9, 10]. This system stores thermal energy generated during the compression process and utilizes it to heat air during expansion process [11]. To optimize the utilization of heat produced by compressors, Sammy et al. [12] proposed a high-temperature hybrid CAES system. This ...

Compressed air energy storage (CAES) is one of the important means to solve the instability of power generation in renewable energy systems. To further improve the output power of the CAES system and the stability of the double-chamber liquid piston expansion module (LPEM) a new CAES coupled with liquid piston energy storage and release (LPSR-CAES) is proposed.

The cost of compressed air energy storage systems is the main factor impeding their commercialization and possible competition with other energy storage systems. For small scale compressed air energy storage systems volumetric expanders can be utilized due to their lower cost compared to other types of expanders.
