Control of Power Electronic Converters and Systems examines the theory behind power electronic converter control, including operation, modeling and control of basic converters. The book explores how to manipulate components of power electronics converters and systems to produce a desired effect by controlling system variables.

Why is controller interaction important in power converters and passive components?

Addressing controller interactions - in light of increasing renewable energy integration and related challenges with stability and power quality - is becoming more frequent in power converters and passive components. Dive into the research topics of 'Control of Power Electronic Converters and Systems: Volume 3'.

Are power electronic converters vulnerable to cyber attacks?

Although remote control capability enables numerous new control functions for grid-tied converters, it also makes them vulnerable to cyber attacks. Hence, this chapter aims to shed light on portions of the power electronic converter control systems, which are vulnerable to cyber attacks.

Why is control effectiveness important in power electronics?

Advances in power electronics enable new applications to emerge and performance improvement in existing applications. These advances rely on control effectiveness, making it essential to apply appropriate control schemes to the converter and system to obtain the desired performance.

What are grid-connected power electronic converters?

Finally, conclusions are drawn. Grid-connected power electronic converters are crucial technologies that allow the electrical grid to interface renewable energy sources, energy storage systems, electrical vehicles, microgrids, and high-voltage DC transmission lines.

Are MPC strategies robust to parameter variations?

However, recent results have shown that some MPC strategies are very robust to parameter variations despite that fact they rely on the model of the plant. Power electronic systems are subject to uncertain and time-variant parameters and also disturbances, e.g., due to aging, thermal effects, load changes, etc.
