What are the subsystems of steam power plant?

The dynamic model of Steam Power Plant is divided into the following subsystems : Drum level, Primary super-heater, Secondary super-heater and turbine unit. The applied modern control algorithms are shown to achieve the desired, high quality, optimized control performance for the boiler subsystems.

Can GE control a steam power plant?

YES. GE has deep experience in automation and controls for steam power plants across all fuels with close to 4,500 control systems in operation around the world. With more than 100 years of automation and controls experience we offer advanced services for all installed turbine controls, excitation systems, and Distributed Control Systems (DCS).

Who controls a steam turbine?

2.4 STEAM TURBINE GENERATOR CONTROL. Steam turbine controls should be supplied by the turbine manufacturer. With the rapid advancement of electronics, an electrohydraulic control (EHC) system is desirable over an all mechanical system.

What is a power station control system?

At power stations used as a base power source, we are working globally on control systems with important functions such as APC that controls the amount of fuel, water, and air supplied to the boiler, and SQC that controls the start and stop of the plant. We have a lot of delivery results.

What are intelligent techniques used in power plant control?

Intelligent techniques applied to power plant control. In: 2006 IEEE Power Engineering Society General Meeting Superheated steam temperature predictive optimal control based on external time-delay BP neural network and a simpler PSO algorithm. In: Neural network-based modeling for a large-scale power plant.

How do you tune a power plant control system?

As stated before, the power plant control system consists of many SISO PI/PID loops which are strongly interacting to each other. The most common method of tuning these controllers in the FFPPs is the so called 'trial and error' method.<sup>11</sup> It generally tunes the control loops sequentially, beginning from the one with least interaction.
