Do distributed photovoltaic systems contribute to the power balance?

Tom Key, Electric Power Research Institute. Distributed photovoltaic (PV) systems currently make an insignificant contribution to the power balance on all but a few utility distribution systems.

Do high penetrations of PV affect grid frequency regulation?

The impact of high penetrations of PV on grid frequency regulation appeared in a 1996 paper from Japan. This study used modeled PV systems that respond to synthetically generated short-term irradiance transients caused by clouds.

What is the upper limit on PV penetration?

For PV penetration of 30%, the authors found that a 10% increase in frequency regulation capacity was required, and that the cost of doing this exceeds any benefit. Based on these two competing considerations, the authors conclude that the upper limit on PV penetration is 10%.

What is the optimum design of ground-mounted PV power plants?

A new methodology for an optimum design of ground-mounted PV power plants. The 3V × 8 configuration is the best option in relation to the total energy captured. The proposed solution increases the energy a 32% in relation to the current one. The 3V × 8 configuration is the cheapest one.

How do PV systems affect the utility grid?

The variability and nondispatchability of today's PV systems affect the stability of the utility grid and the economics of the PV and energy distribution systems. Integration issues need to be addressed from the distributed PV system side and from the utility side.

Which photovoltaic rack configuration is best?

(ii) The 3 V × 8 configuration with a tilt angle of 14 (°) is the best option in relation to the total energy captured by the photovoltaic plant, due to the lower width of the rack configuration and its lower tilt angle, which allows more mounting systems to be packed.
