At its core, a battery active balancer is an advanced electronic system engineered to manage and regulate individual cells within a battery pack. Its primary function is to ensure that each cell maintains a balanced charge, preventing overcharging or over-discharging that can lead to reduced capacity and a shortened lifespan. By achieving ...

Passive and active cell balancing are two battery balancing methods used to address this issue based on the battery"s state of charge (SOC). To illustrate this, let"s take the example of a battery pack with four cells connected in series, namely Cell 1, Cell 2, Cell 3, and Cell 4. Before balancing, the SOC level of cells L1,L2,L3, and L4 ...

Overcharging and overheating of the battery lead to a reaction of the active components with electrolyte and with each other ultimately, inducing explosion and fire. Thermal run-away can be caused merely by overcharging a single cell to voltages above 4.35 V [33]. Other cells of the pack will also join the explosive chain reaction if one cell ...
