Can wind deflectors improve the performance of vertical wind turbines?

Recent developments have also focused on enhancing the efficiency of arrays of vertical wind turbines .. Moreover, wind deflectors or guiding vanes are being studied as a solution to the performance challenges of some turbines .

Can a deflector increase the power coefficient of a wind turbine?

Augmented devices such as deflectors can increase the power coefficient of wind turbines above the Betz limit . In this case, a flat plate is one deflector type with the most basic shape.

Can an upstream deflector improve the efficiency of a vertical axis wind turbine?

The suitability of using an upstream deflector to improve the efficiency of a vertical axis wind turbine is presented in this study. A two-dimensional vertical axis wind turbine (VAWT) was modelled and simulated using ANSYS Fluent 14.0 computational fluid dynamics (CFD) software to solve the k-epsilon (RNG) turbulence model.

Do wind deflectors improve rotor performance?

Wind deflectors in small wind turbines are installed to improve the static torque generated by the rotor; however, in large wind turbines, their applications improve the ventilation to enhance the thermal performance of the stator generator [67].

Does lower deflector porosity affect wind turbine performance?

Nimvari et al. (Eshagh Nimvari et al. 2020) first investigated the effect of porosity of the lower deflector on the wind turbine efficiency, and they reported that the Savonius wind turbine gives optimum performance at porosity 0.9 of the lower deflector.

Can flat plate deflectors improve wind turbine efficiency?

In addition, Rajpar et al. stated that using flat plate deflectors in Savonius turbines with two blades can produce a result or augmented gain of 27.3%. In their research, Qasemi and Azadani also revealed that using deflectors with optimum parameters could increase the efficiency of wind turbines by 16.42% compared to bare turbines. ...
