uses the form of energy (like coal and diesel) and converts it into electrical energy. The power system includes the devices connected to the system like the synchronous generator, motor, transformer, circuit breaker, conductor, etc.

The subsystem represented in Figure 1(a) could be one of a final user of the electric energy of a full power system. The subsystem represented in Figure 1(b) could be one of a small power plant working as distributed generation (DG). Most of these power systems operate only when connected to a full power system.

The power system, the largest and one of the most important topics in electrical engineering has a major weightage in ESE, ranging from 16-18% in the objective paper to 25-27% in the standard paper. To avoid wasting time, a smart approach should be used while addressing a subject with an enormous syllabus and weighted grades.

Primary transmission. The electric power at 132 kV is transmitted by 3-phase, 3-wire overhead system to the outskirts of the city.This forms the primary transmission. Secondary transmission. The primary transmission line terminates at the receiving station (RS) which usually lies at the outskirts of the city.At the receiving station, the voltage is reduced to 33kV by step ...
