What is the ambient temperature of a generator set?

So at 18:24, the ambient capability =  $(230 - 198.3) + 82.0 = 113.7$ °F. In this case, the generator set can continue to operate at full load with an outside air temperature of nearly 114° F. When the ambient temperature is at the maximum 114° F (generator set ambient capability), the air temperature at the radiator core would be 148° F.

How hot does a generator set get?

The test sample in Table 1 shows the heating effect on the cooling air of a generator set with an enclosure fitted. At 18:24 in Table 1, the ambient temperature was reported to be 82° F. In this example, the maximum allowable top tank temperature is 230° F.

What temperature should a generator exhaust be recirculated?

Under fully loaded conditions, the temperature of flue exhaust from generator sets can be in excess of 900 F and the radiator (engine-driven or remote) discharge air temperature can be in excess of 160 F. Any recirculation of these high-temperature airstreams can cause the ventilation air temperature to exceed the ambient temperature.

Can evaporative cooling be used in a generator room?

If elevated ventilation air temperatures cannot be avoided due to site constraints, one option is to use evaporative cooling technology to cool the air entering the generator room. This technology incorporates an evaporative media or mesh that is installed at the ventilation air source such as louvers.

How does air temperature affect gen set cooling system sizing?

Altitude, air temperature and velocity greatly affect cooling ability and performance. Following are some rules of thumb that may be used in general gen set cooling system sizing exercises: For every 304.0m (1,000 feet) above sea level, deduct 1.38C (2 F) from the observed ambient temperature for a better indication of the air's cooling ability.

How should a generator be ventilated?

Preferably, the source of ventilation air should be as low as possible and the air should flow over the entire generator set, thereby cooling the alternator, engine block, and radiator (for sets with unit-mounted radiators) to remove the after-cooler and jacket-water heat.
