What are the different types of generator cooling systems?

Each generator set manufacturer offers different options for design of the cooling system. The two most common styles of cooling systems are closed loop and open loop systems. Closed loop systems incorporate cooling pump (s), cooling fan and radiator (s) located on a skid as an all in one unit.

What are the components of a generator cooling system?

Coolant System - Each generator application can have a different cooling system configuration. Below is a general list of components:

- o Coolant pump- Depending on engine size, belt or gear driven. Circulates coolant throughout cooling system.
- o Radiator - Can be single or twin radiator design.

How does a generator cooling system work?

An ethylene glycol based coolant is circulated through the cooling system components. Three common cooling system configurations are: Single Pump Single Loop (SPSL) - SPSL systems are common in smaller to mid-size generator applications. Operation for this system as follows:

- o Engine starts, direct drive pump is driven and fan clutch is rotating.

How do I know if my generator is working properly?

Control systems can allow for full open or full close. Advanced control systems can allow for louver to open as much as required for premium operation. Cooling System Inspection - General cooling inspections should be completed during generator down time and while generator is in operation.

How do I know if my generator needs a louver?

Advanced control systems can allow for louver to open as much as required for premium operation. Cooling System Inspection - General cooling inspections should be completed during generator down time and while generator is in operation. Manufacturer's recommendations always should be followed.

What are the requirements & standards for engine-generators?

This guideline defines the requirements and standards for design of engine-generators and associated system components. The guideline covers basic requirements for design, system components, controls, natural gas fuel systems, exhaust systems, automatic transfer switches (ATSs), room construction, outdoor enclosures and installation.
