

What is a solar thermal power plant?

Solar thermal power plants are active systems, and while there are a few types, there are a few basic similarities: Mirrors reflect and concentrate sunlight, and receivers collect that solar energy and convert it into heat energy. A generator can then be used to produce electricity from this heat energy.

What is solar thermal energy?

Solar thermal energy (STE) is a form of energy and a technology for harnessing solar energy to generate thermal energy for use in industry, and in the residential and commercial sectors. Solar thermal collectors are classified by the United States Energy Information Administration as low-, medium-, or high-temperature collectors.

How does solar thermal power work?

Solar thermal power generation uses the sun as a source of heat. As discussed above, the energy reaching the earth's surface is mostly either infrared or visible radiation. A solar thermal plant can utilise the infrared and a small part of the visible spectrum. This energy is absorbed and used to raise the temperature of a heat transfer fluid.

What is solar thermal power generation?

Harnessing solar energy for electric power generation is one of the growing technologies which provide a sustainable solution to the severe environmental issues such as climate change, global warming, and pollution. This chapter deals with the solar thermal power generation based on the line and point focussing solar concentrators.

Are solar thermal power plants a good idea?

Solar thermal power plants benefit from free solar energy for clean electricity production with low operational cost and greenhouse gases emissions. However, the major hurdle for developing these plants is the intermittence of solar energy leading to a mismatch of energy production with the energy demand.

Could solar thermal power provide more than a global electricity need?

Estimates for global solar thermal potential indicate that it could more than provide for total global electricity needs. There are three primary solar thermal technologies based on three ways of concentrating solar energy: solar parabolic trough plants, solar tower power plants, and solar dish power plants.
