What is solar energy & how does it work?

By far the most common solar energy technology, photovoltaics are an "additive" energy source that can be used on a single home's rooftop or in a large farm producing thousands of megawatts of electricity--enough to power a midsize city. Instead of turning sunlight directly into electricity, concentrating solar turns it into heat.

How does a solar thermal system produce electricity?

A solar thermal system generates electricity indirectly by capturing the heat of the sun to produce steam, which runs a turbine that produces electricity. A solar photovoltaic system produces electricity directly from the sun's light through a series of physical and chemical reactions known as the photovoltaic effect.

How does sunlight convert energy into electricity?

The energy of collected sunlight is transformed directly into electricity thanks to the photovoltaic effect. In short, this effect takes place when photons (tiny electromagnetic particles) of light are absorbed by a specific material, which in turn releases electrons from atoms.

How is solar radiation converted into electricity?

Solar radiation may be converted directly into electricity by solar cells (photovoltaic cells). In such cells, a small electric voltage is generated when light strikes the junction between a metal and a semiconductor (such as silicon) or the junction between two different semiconductors. (See photovoltaic effect.)
