How to design a solar generator?

The first step in designing the solar generator is estimating your energy needs. To estimate the energy consumption for the desired devices, we can use the formula: Energy (in watt-hours) = Power (in watts) x Time (in hours) Let's calculate the energy consumption for each device: 6W LED for 6 hours: Energy = 6W x 6h = 36 Wh

How to install a solar generator?

Insert one of the supplied mounting bolts through the top hole of the clamp and mark its position on the wall of the solar generator case. Now you can remove the battery and drill an appropriately sized hole through the case wall at your mark. Use the set clamp to index the top hole so you can mark the bottom hole.

How do you ventilate a solar generator?

The most common way for DIY solar generator builders to ventilate and cool the equipment is to use computer-style fans mounted on the sides of the box. Solar generators run hot, but auxiliary fans are not necessary when your inverter has good ventilation.

How do I know if my solar generator is working?

If not, you can simply use a multimeter to check for 12 volts on the socket. Monitor the inverter's LCD and operate the remote switch checking to turn the inverter off and on. If all the DIY solar generator components are working OK, you can wrap up the build by cleaning up the wiring.
