

How to improve the resilience of microgrids

Can microgrids improve resilience of power systems?

In recent years, much research has been conducted on utilizing microgrids (MGs) to enhance the resilience of power systems, especially for distribution systems. MGs are regarded as localized small power systems, which have two operational modes: grid-connected mode and islanded mode .

What are microgrid-based resilience enhancement approaches in distribution systems?

The objective of this paper is to present an updated comprehensive review of the literature on two main categories of microgrid-based resilience enhancement approaches in distribution systems: 1) optimal microgrid formation and 2) optimal microgrid scheduling and energy management.

How to rebuild resilient microgrids in real-time?

The objective is to rebuild resilient microgrids in real-time by distributing the load between the two buses to maintain self-sustainability of each bus. The operation modes of microgrids are divided into normal and self-healing modes by and different operation schemes are devised for each mode.

How resiliency cuts can be used in microgrids?

History data can be used to predict the occurrence of a particular event and normal operation schedule of microgrids can be revised via resiliency cuts. Resiliency cuts refer to additional resiliency constraints, which are introduced in the original problem (proactive operation phase) to achieve a certain resilience target.

Do nested microgrids increase resiliency?

Nested microgrids are suggested by for enhancing the resilience of microgrids in islanded mode. Due to the ability of the nested microgrids to form sub-groups, the resiliency of the disconnected microgrids increases and the probability of forming sub-groups increases with increases in the number of microgrids.

Does a microgrid have a local resiliency enhancement algorithm?

A network of microgrids having their own local resiliency enhancement algorithm is proposed in . The concept of adjustable power is adopted in to share the power from cheaper generation sources of other microgrids of the network to fulfill the resiliency requirements of all the microgrids in the network.
