For example, if the fans in the power supply spin up when you power on a system, but the motherboard itself doesn't start, it is possible that capacitors on the motherboard have become distended. If this happens, inspect the motherboard and look for capacitors that are swollen on top or leaking brown liquid.

6. When you think you have the problem resolved, switch to the front view of the computer. Press the power button to see if the computer starts. If successful, the screen will change to the BIOS and operating system load screen. 7. If the computer still does not come on, repeat steps 3 through 5 to correct the problem. 1 of 1 2/25/2019, 3:34 PM
