Is Sudafed safe to take with lithium?

It is considered safe to take with lithium. Sudafed (pseudoephedrine) is a nasal decongestant that has no known drug interaction with lithium. Additionally, Sudafed PE, which contains phenylephrine, is not known to interact with lithium. It is always a good idea to check into potential drug interactions before taking over-the-counter medication.

Is akathisia a side effect of lithium?

  class="df_pExpInfoRoot"><p class="df_Name">Dr. Ilya Aleksandrovskiy

Akathisia can occur as a side effect of long-term use of antipsychotic medications, such as lithium.

Why can't I buy Sudafed OTC?

You can't buy Sudafed OTC anymore. In its place is something called Sudafed PE, which is useless. Why? It's all about crystal meth. A little chemistry lesson. The drug phobia that now has us firmly in its grip, you know, the "let's restrict everything" mentality, didn't start with Vicodin, Valium, or Ritalin.

Can NSAIDs cause lithium toxicity?

Over-the-counter NSAIDs include: NSAIDs decrease blood flow in the kidneys, which results in decreased lithium clearance and increased serum lithium concentrations. This increases the risk of side effects. A variety of studies have shown that lithium toxicity has resulted from interactions between an NSAID and lithium.

Can you buy Sudafed without a prescription?

In an effort to curb illegal meth production, a law was passed in 2006 that required a prescription to purchase Sudafed. Afterward, an updated version of Sudafed that did not include pseudoephedrine, called Sudafed PE, was created. This version cannot be converted to meth and can be purchased without a prescription.

Why was Sudafed replaced with a decongestant?

The Act was intended to put a dent in the illegal production of methamphetamine, which was heavily abused at that time, especially in poorer areas of the US. Sudafed was replaced by another decongestant Sudafed PE, which cannot be converted to methamphetamine, but doesn't work as well.

Lithium-ion batteries are the most widespread portable energy storage solution - but there are growing concerns regarding their safety. Data collated from state fire departments indicate that more than 450 fires across Australia have been linked to lithium-ion batteries in the past 18 months - and the Australian Competition and Consumer Commission (ACCC) recently ...

Not only does proper lithium battery storage ensure safety, but it also protects your investment by maximizing battery lifespan and maintaining peak performance. When learning how to store lithium batteries safely and effectively, three primary factors play a crucial role in maintaining their performance and extending their lifespan:

Store lithium-ion batteries and products in cool, dry places and out of direct sunlight. Allow the lithium-ion battery to cool after use and before recharging. Buy replacement batteries from the original supplier or a reputable supplier where possible. Keep lithium-ion batteries separate from each other when removed from products. What not to do

Homes containing a meth lab may have either (1) a large amount of a single meth ingredient, such as Sudafed, or, alternatively (2) a significant number of ingredients and supplies used to make meth. Here are some typical meth-making ingredients and supplies: cold medications containing ephedrine or pseudoephedrine; lithium batteries

The common ingredients in which meth is made out of are acetone, anhydrous ammonia, pseudoephedrine, hydrochloric acid, and lithium. How meth is cooked is dangerous because of the hazardous chemicals and risks of fires. Signs that a house is meth lab are blacked-out windows, many chemical containers, and hoses

Lithium-ion batteries have many advantages, but their safety depends on how they are manufactured, used, stored and recycled. Photograph: iStock/aerogondo. Fortunately, Lithium-ion battery failures are relatively rare, but in the event of a malfunction, they can represent a serious fire risk. They are safe products and meet many EN standards.

Human Toxicity from Damage and Deterioration. Before lithium-ion batteries even reach landfills, they already pose a toxic threat. When damaged, these rechargeable batteries can release fine particles--known as PM10 and PM2.5--into the air. These tiny particles, less than 10 and 2.5 microns in size, are especially dangerous because they carry metals like arsenic, ...
