When an ideal inductor is connected to a voltage source with no internal resistance, Figure 1(a), the inductor voltage remains equal to the source voltage, E such cases, the current, I , flowing through the inductor keeps rising linearly, as shown in Figure 1(b). Also, the voltage source supplies the ideal inductor with electrical energy at the rate of $p = E \cdot I$.

Energy stored in coupled inductors refers to the magnetic energy accumulated within the magnetic field created by two or more inductors that are magnetically linked. This energy is a result of mutual inductance, where the changing current in one inductor induces a voltage in another inductor, allowing energy transfer between them and creating a shared magnetic field.

consider equal energy storage in nominal dc conditions. Because the magnetizing inductance's energy storage is negligible when the magnetizing path is ungapped, equal energy storage implies that the values of the leakage inductances L_{l1} and L_{l2} are equal to the values of the uncoupled inductors.
