Why do we simplify energy storage mathematical models?

Simplification of energy storage mathematical models is common to reduce the order of the equivalent ECM circuits, or to completely idealize them both with and without taking into account the SOC dependence.

What is the average model of the energy storage unit (ESS)?

Average model of the ESS. In this model, the whole power converter interface of the energy storage unit is replaced by ideal voltage sources, which reproduce the averaged behavior of the VSC legs during the switching interval.

How can energy storage models be implemented?

It should be noted that by analogy with the BESS model, the SC, FC and SMES models can be implemented considering their charging and discharging characteristics. In addition, by applying a similar approach to the design of the energy storage model itself, they can be implemented in any other positive-sequence time domain simulation tools.

How is energy storage reproduced in a DC-DC converter?

In this model, the energy storage is reproduced by a DC voltage in accordance with the output characteristics of the particular energy storage unit. The model does not represent the processes in the energy storage and DC-DC converter as well as their control systems.

How do energy storage systems affect the dynamic properties of electric power systems?

With the development of electric power systems, especially with the predominance of renewable energy sources, the use of energy storage systems becomes relevant. As the capacity of the applied storage systems and the share of their use in electric power systems increase, they begin to have a significant impact on their dynamic properties.

Are energy storage systems a part of electric power systems?

The share of global electricity consumption is growing significantly. In this regard, the existing power systems are being developed and modernized, and new power generation technologies are being introduced. At the present time, energy storage systems (ESS) are becoming more and more widespread as part of electric power systems (EPS).
