An organic solar cell or plastic solar cell is a type of polymer solar cell that uses organic electronics, a branch of electronics that deals with conductive organic polymers or small organic molecules, for light absorption and charge transport to produce electricity from sunlight by the photovoltaic effect.

Organic solar cells are a type of photovoltaic cell that uses conductive organic polymers or small organic molecules to absorb light and transport charges. They typically consist of two semiconducting layers made of polymers or other flexible materials. When light is absorbed, an exciton is generated which splits into an electron and hole.
