How do wind turbines work?

We can thank recent advances in wind turbine technology, and economies of scale from its rapid growth, for this ultra-cheap energy. 4 Wind turbines aren't "pushed" like sails catching the wind: they actually work more like airplane wings, with blades shaped so that wind flows unequally fast above and below them.

How has wind energy changed over the past 40 years?

Over the past 40 years, turbine blades have become longer and lighter, letting them turn faster with less wind. Modern turbines also pivot automatically to catch the wind at the best angle. These and other advances have led the price of wind energy to fall almost 95% since 1980. 5

Do wind turbines take up a lot of land?

In the U.S., around 90% of wind turbines are built on cropland or rangeland for grazing animals, most of it actively used. 9 In this sense, wind energy "takes up" hardly any land at all. Wind turbines can also be built offshore, sharing space with fishing and shipping.

What is wind energy & how does it work?

Wind energy is a form of renewable energy, typically powered by the movement of wind across enormous fan-shaped structures called wind turbines. Once built, these turbines create no climate-warming greenhouse gas emissions, making this a "carbon-free" energy source that can provide electricity without making climate change worse.

How can wind energy be saved?

Energy storage (saving some energy for later when wind turbines are over-producing) and long-distance transmission (moving electricity from places with lots of wind to places with lots of demand) can help the energy system rely more heavily on wind power around the clock. Wind energy also needs wide stretches of open space.

Are wind turbines a carbon-free energy source?

Once built, these turbines create no climate-warming greenhouse gas emissions, making this a "carbon-free" energy source that can provide electricity without making climate change worse. Wind energy is the third-largest source of carbon-free electricity in the world (after hydropower and nuclear) 1 and the second-fastest-growing (after solar). 2
