How do you measure the insulation resistance of a PV inverter?

One method is to measure the insulation resistance of each panel with respect to ground. This indirectly also measures the leakage current. The measurement is usually done before the turning on of the PV inverter or at least once or twice per day. For a 1000 Vdc system, normal practice requires insulation resistance to be more than 1 M Ω .

What is a high voltage system in a PV inverter?

High voltage system in PV inverters operation requires a safe insulation resistance between the PV panel to ground. A poor insulation resistance less than 1 M Ω leads to a high leakage current (about 1 mA), which not only will damage the system but also injure the user.

How to measure the insulation resistance of a solar PV system?

The IEC62446-1 standard describes two methods for measuring the insulation resistance of a solar PV system.

1. To short the positive and negative electrodes of the PV string, and measure the insulation resistance between the shorting point and earth. 2.

What is the minimum insulation resistance of a PV module?

This means that a PV module with a module surface area of 1 m² must have a minimum insulation resistance of 40 M Ω , a PV module with a surface area of 2 m², however, only a minimum of 20 M Ω . As the heart of the PV plant, the inverter monitors the insulation resistance of the entire system (all PV modules, DC cabling, installation and inverter).

What is an example of PV panel insulation resistance measurement circuit?

One example of PV panel insulation resistance measurement circuit is shown in Figure 2. Assuming that the rated voltage of the individual PV panel is 1000 Vdc during bright sunny day, good PV panel insulation resistance recorded is 2 M Ω and bad insulation resistance is 100 k Ω .

What does a PV inverter do?

As the heart of the PV plant, the inverter monitors the insulation resistance of the entire system (all PV modules, DC cabling, installation and inverter). As mentioned above, this is particularly important in PV plants without galvanic isolation from the grid, since a single short circuit can lead to personal injury or damage.
