

Organic-inorganic halide perovskites (14-17) have shown great potential in photovoltaic and electro-optical devices due to their excellent semiconducting properties. The lead iodine octahedra in hybrid perovskites control the band-edge electronic structure and make them good semiconductors with strong spin-orbit coupling, while the organic groups serve as structural ...

1 Introduction. Halide perovskites promise exceptional performance in optoelectronic applications ranging from inexpensive, high-performance photovoltaic (PV) modules [1-6] to light-emitting and lasing devices. [7-9] These perovskites display a rare combination of properties including pronounced optical absorption in conjunction with relatively ...

Nowadays, the soar of photovoltaic performance of perovskite solar cells has set off a fever in the study of metal halide perovskite materials. The excellent optoelectronic properties and defect tolerance feature allow metal halide perovskite to be employed in a wide variety of applications. This article provides a holistic review over the current progress and future ...

This review summarized the challenges in the industrialization of perovskite solar cells (PSCs), encompassing technological limitations, multi-scenario applications, and sustainable development ...

Solar cells based on organic-inorganic hybrid perovskite materials have emerged as the most efficient next-generation thin-film solar cells within just a decade of research and show great promise for commercialization. As control of the thin-film microstructure of the perovskite layer is a key factor enabling high photovoltaic efficiency, good stability, and ...

Perovskites have a closely similar crystal structure to the mineral composed of calcium titanium oxide, the first discovered perovskite, but researchers are exploring many perovskite options like the methyl ammonium lead triiodide ( $\text{CH}_3\text{NH}_3$ ). This mineral can be modified to adopt custom physical, optical, and electrical characteristics, making it more ...

Forming 2D capping layers atop the bulk perovskite, and hence a 3D-2D heterojunction with lattice matching, is one successful passivation strategy for perovskites and thin-film PV materials more generally. Insertion of an interlayer, such as few-nanometer-thick  $\text{LiF}_2$  or  $\text{MgF}_2$ , is another powerful passivation method, which tends to reduce ...

2 Coating and Printing Techniques for Perovskite Photovoltaics. Although spin coating continues to pioneer laboratory-scale studies to control and optimize PSC film morphology, the techniques and understanding from these laboratory-scale results must be transferred into a scalable, high-throughput coating processes to yield closed films with large perovskite grains.

# Photovoltaic perovskites

A new study has unlocked nanoscale secrets for designing next-generation solar cells. The work will help researchers tune surface properties of perovskites, a promising alternative and supplement to silicon, for more ...

Recently, an anomalous photovoltaic effect in laterally structured perovskite solar cells was discovered, whereby the largest obtained V<sub>OC</sub> of 18 V in a device with an electrode spacing of 100  $\mu\text{m}$  ...

Organic-inorganic halide perovskites (14-17) have shown great potential in photovoltaic and electro-optical devices due to their excellent semiconducting properties. The lead iodine octahedra in hybrid perovskites control the band ...

3D perovskites have exceptional electrical and optical properties, which have enabled their widespread use as an active layer in optoelectronic and, in particular, PV devices 3,6. Some of the most ...

The band gap of formamidinium lead iodide (FAPbI<sub>3</sub>) perovskites allows broader absorption of the solar spectrum relative to conventional methylammonium lead iodide (MAPbI<sub>3</sub>) cause the optoelectronic ...

Photovoltaic technology is becoming increasingly important in the search for clean and renewable energy 1,2,3. Among the various types of solar cells, PSCs are promising next-generation ...

Over the past decade, metal halide perovskite photovoltaics have been a major focus of research, with single-junction perovskite solar cells evolving from an initial power conversion efficiency of ...

In general, photovoltaic performance of the perovskite solar cells is ascribed from their intrinsic properties like high absorption coefficient [23], tunable band gap [24], large carrier diffusion-length [25], ambipolar carrier-transport ability [26] and carrier mobility [27]. Especially, organic-inorganic hybrid-perovskite (OHIP) materials are the favorable candidates for ...

In May, UK-based Oxford PV said it had reached an efficiency of 28.6% for a commercial-size perovskite tandem cell, which is significantly larger than those used to test the materials in the lab ...

Organic-inorganic perovskites used for photovoltaics have an AMX<sub>3</sub> structure where A is a monovalent cation such as Cs, methylammonium (MA), or formamidinium (FA), M is a divalent metal such as Pb or Sn, and X represents halide anions. A stable 3D perovskite can be formed only when the Goldschmidt tolerance factor ( $t$ ) is in the range of  $\sim 0.8-1$  based on a ...

The band gap of formamidinium lead iodide (FAPbI<sub>3</sub>) perovskites allows broader absorption of the solar spectrum relative to conventional methylammonium lead iodide (MAPbI<sub>3</sub>) cause the optoelectronic properties of perovskite films are closely related to film quality, deposition of dense and uniform films is crucial for fabricating high-performance perovskite ...

The bulk photovoltaic effect (BPVE), a kind of nonlinear optical process that converts light into electricity in solids, has a potential advantage in a solar cell with an efficiency that exceeds ...

Currently, perovskite-based single-junction solar cells have achieved power conversion efficiency (PCE) of 23% [16]. However, further developments of perovskites seemingly suffer from a dilemma between high performance and instability issues [17]. HPs with the general formula  $ABX_3$  have a perovskite structure, but the most studied HP for PSCs,  $MAPbI_3$ , ...

As control of the thin-film microstructure of the perovskite layer is a key factor enabling high photovoltaic efficiency, good stability, and successful up-scaling of high-quality perovskite thin ...

a, Photograph of a perovskite PV device emitting light while under forward electrical bias. b, Illustration of photon recycling in a solar absorber layer. External incident light (yellow wavy arrows ...

This Review discusses recent developments in photovoltaic and light-emitting optoelectronic devices made from metal-halide perovskite materials. Metal-halide perovskites are crystalline materials ...

While research groups continue to report on outdoor testing of single- or multi-junction perovskite cells [155] for demonstrating durability, perovskite startups such as Wondersolar have commenced field testing of their modules in the cities of Hangzhou and Ezhou. [156] Most notably, Saule Technologies, collaborating with Aliplast and Somfy, have ...

**INTRODUCTION.** Metal halide perovskite solar cells (PSCs) have garnered considerable attention in the field of photovoltaics due to their remarkable and rapid advancements [1]. Over a span of just over a decade, their certified power conversion efficiency (PCE) has surged to 26.1%, approaching the upper limit observed in crystalline silicon cells [1]. ...

Perovskite solar cells (PSCs) are attractive due to their fast-increasing device efficiency, yet their further improvement is limited by their suboptimal morphology and intrinsic defects. To assess how the widely used additive engineering impacts crystal growth and defect passivation, we herein propose a simple but effective strategy to disentangle the influence of ...

Our low-cost, highly efficient solar photovoltaic technology integrates with standard silicon solar cells to dramatically improve their performance. Built into solar panels, our tandem solar cells deliver more power per square metre - critical for enabling more affordable clean energy, accelerating the adoption of solar, and addressing the ...

Fundamental research in the field of photovoltaic perovskites is accelerating. A literature survey conducted in 2012 with the term "perovskite-based solar cells" in the heading produced about 7 results; however, by 2023, that number had increased to 1760. Due to intense efforts, the PCEs of PSCs have increased from 9.7 to 25.2%
