

What factors affect the bearing capacity of new cable-supported photovoltaic modules?

The pretension and diameter of the cables are the most important factors of the ultimate bearing capacity of the new cable-supported PV system, while the tilt angle and row spacing have little effect on the mechanical characteristics of the new type of cable-supported photovoltaic modules.

What is cable-supported photovoltaic (PV)?

Cable-supported photovoltaic (PV) modules have been proposed to replace traditional beam-supported PV modules. The new system uses suspension cables to bear the loads of the PV modules and therefore has the characteristics of a long span, light weight, strong load capacity, and adaptability to complex terrains.

What are the characteristics of a cable-supported photovoltaic system?

Long span, light weight, strong load capacity, and adaptability to complex terrains. The nonlinear stiffness of the new cable-supported photovoltaic system is revealed. The failure mode of the new structure is discussed in detail. Dynamic characteristics and bearing capacity of the new structure are investigated.

What is a PV support structure?

Support structures are the foundation of PV modules and directly affect the operational safety and construction investment of PV power plants. A good PV support structure can significantly reduce construction and maintenance costs. In addition, PV modules are susceptible to turbulence and wind gusts, so wind load is the control load of PV modules.

How does torsion stiffness affect load bearing capacity of PV system?

The increase of torsion stiffness when the torsion displacement rises benefits the stability of the new PV system. The load bearing capacity of the PV system is discussed under self-weight, static wind load, snow load, and their combination.

How to design a PV support system?

When designing PV support systems, the wind load is the primary load to consider for PV power generation. The amount of the PV wind load is influenced by various elements, such as the panel inclination angle, wind direction angle, body type coefficient, geometric scale, shielding effect, and template gap.

The suspension cable structure with small sag-span ratio (less than 1/30) is adopted in the flexible photovoltaic support, and it has strong geometric nonlinearity. ... Ma Wenyong, Sun Gaojian, ...

Bjorn Wolff et al. proposed a PV power physical model based on Cloud Motion Vector (CMV) and Numerical Weather Prediction (NWP), compared it with the Support Vector Regression (SVR) ...

FEA is done by using load calculation with creating model in SAP2000 and followed by analysis to determine

... FEA and research on the bearing capacity of the PV support structure under ...

The model for the fluid-structure interaction (FSI) analysis is presented in Fig. 6. The overall layout of the fluid domain and photovoltaic support structure is presented in Fig. 6. ...

3 ???&#0183; The experimental results indicate that under the uniform load the failure mode of PV support is overall instability due to the torsion deformation of the purlins, but the bearing ...

The research on the ultimate bearing capacity of PV support has also focused on fixed PV support, exploring structural aerodynamic damping [25], ultimate state inclination ...

In this paper, the new flexible photovoltaic support structure is summarized, and the related research articles on the structural design model and wind-induced effect of the flexible ...

For an offshore photovoltaic helical pile foundation, significant horizontal cyclic loading is imposed by wind and waves. To study a fixed offshore PV helical pile's horizontal ...

system models require explicit representation of the generation in the power flow model. PV power plant modeling will continue to be an area of active research. Models will continue to ...
