What is the difference between a thermoelectric and a photovoltaic?

Thermoelectrics**: Visible sunlight converted into heat; temperature difference between leads drives an electrical current. Long- PV: Visible sunlight converted into heat, which powers IR-responsive photovoltaic devices. Hybrids Possible (e.g., combined cycle power plant): The above, in tandem with another fuel (e.g., natural gas).

Features two enlarged chapters--one on up-to-date photovoltaic metrology and the other on the future developments in photovoltaics; Comes along with the accompanying website which offers free downloadable figures of the book, solutions of exercises, additional free PV software etc.

What is photovoltaic (PV) technology and how does it work? PV materials and devices convert sunlight into electrical energy. A single PV device is known as a cell. An individual PV cell is usually small, typically producing about 1 or 2 watts of power. These cells are made of different semiconductor materials and are often less than the thickness of four human hairs.
