

As others said: deactivate all your plugins and switch to a default theme. If the issue goes away, then activate plugins and theme one by one checking each time if the issue comes back until you hit the one is causing problems. But, if you deactivate plugins and theme, and the issue persists, then is nothing related to those things. This is the basic way to troubleshoot ...

I'm trying to take one input parameter which is username or email for sign in purposes. This is submitted to a single input which gonna accept email or username. The query will try to find match whether for email or username `SELECT id FROM account WHERE email = '$1' OR username = '$1'` is this good/safe or there are better way?

Find great offers on Water Purifier Cubes Horse Trough Eco Aquarium Fish Tank Purification Clean Eco-aquarium at Matt Blatt. Check out our extensive selection of Filters, and explore ...

Executing this yields the error: `ActiveRecord::PreparedStatementInvalid` (missing value for `:alnum` in `SELECT`) In other words, Rails thinks that `:alnum` is a named placeholder. But it isn't, it's a PostgreSQL `''` keyword, so my question is: How can I use named placeholders in queries and PostgreSQL's `:alnum` at the same time?

The question mark is a placeholder in your SQL statement that is given a real value when the statement is executed. They're known as query parameters. As others have said, they're a way to prevent SQL injection, but also they make your code much more readable in any case, so if you're putting SQL into any programming language, use parameters.

I looked at the docs for `react-query`, and it follows the same pattern: prefetching, hoisting, and router integration. The `Urql` docs only mention suspense in an SSR context, and I couldn't find anything recommending an approach that would be affected by these changes.

The aquarium cube filter ensures consistent water clarity, supporting fish tanks, ponds, and horse troughs with multi-scenario compatibility and adaptable cube-shaped design for different ...

SQLite - can I use placeholder for table names? I'm looping and with each loop I manipulate data and then save it to different CSV file. Now I'm trying to do the same with SQLite. I have many tables but for sake of simplicity, let's say I have 3 tables: `first_table`, `second_table`, `third_table`

(KRON) -- A popular Korean fried chicken chain from Los Angeles is opening its first Bay Area location. Chimmelier will open on Monday, Dec. 30 in the Thousand Oaks neighborhood of ...
