What are the most common solar panel problems?

By far the most common solar panel problem - 15% of owners told us they'd had problems with their solar inverter. Inverters aren't expected to last as long as the solar PV panels themselves, so you're likely to have to replace yours at least once over the course of your solar panels' lifetime.

Are solar panels defective?

While modern manufacturing processes are constantly improving, solar panels can still develop defects during production. These common solar panel defects can impact performance, longevity, and safety. The first group of defective solar panels is related to cell issues that are easy to notice even before installation.

What causes a solar panel to fail?

Hail is another major cause of stress for solar owners. Large hailstones can crack the glass and damage the underlying cells. It causes solar damage, significantly reducing efficiency and performance. Debris is another common reason for a cracked solar panel.

What happens if your solar panels get damaged?

ALTERNATIVELY: If your solar panels become damaged then they won't be able to perform at their best. Whilst all solar panels are designed to be robust and to withstand the elements, sometimes cracks and damage can occur to the panels for a variety of reasons.

What happens if a solar PV system fails?

But if your solar PV system does have problems, it can mean it stops producing electricity and needs urgent maintenance. That can be costly when you're used to using free solar power and have to use pricey grid electricity instead. Plus, you'll lose out on any payments you get for exporting electricity.

What happens if solar panels run at high voltages?

Strings of solar panels operate at high voltages, up to 600V or higher. Operating at these elevated voltages over many years can, in some cases, allow a current leak to develop through the cells to the aluminium frames of the solar panels and into the earth, resulting in a significant performance loss.
