What is a schematic diagram of a chiller system?

The schematic diagram of a chiller system provides a visual representation of the different components and how they are interconnected. It helps engineers and technicians understand the system's functionalities, troubleshoot any issues that may arise, and optimize its performance.

What are chilled water diagrams?

Let's check out some chilled water diagrams and what are they. A standard chilled water system diagram consists of the chiller, cooling tower and pump. The chilled water distribution to AHUs and FCUs is usually included unless the system is large until a separate diagram is needed.

What are the components of a chiller?

A chiller is made up of the 4 major components required for the refrigeration process which are: a) compressor, b) condenser, c) evaporator and d) expansion valve. To produce chilled water, the refrigerant absorbs heat from the water and thus, chilling the water to about 6.7°C (44°F).

What is a chiller & how does it work?

Chiller is the heart of the chilled water system. It is the one that produces chilled water or low-temperature water for air handlers or AHUs to perform the cooling and dehumidification process. Chiller is also the most "power-hunger" component. The basic working principle of a chiller is similar to the air conditioner used in our home.

What is a chilled water system with heat recovery chiller?

The figure below shows the schematic diagram of a chilled water system with heat recovery chiller. Thermal energy storage (TES) refers to technologies that store energy in a thermal reservoir for later re-use. The energy is usually stored in the form of ice. Therefore, the system is commonly referred to "Ice-storage system".

How do series chillers work?

Pressure losses are additive when the chillers are piped in series. This increases total system pressure drop, thereby using more pump energy. On the other hand, series chillers work particularly well in low-flow systems, where the system temperature difference is greater than 14°F [7.8°C], resulting in less pressure drop.
