

Are silico-aluminophosphates porous materials for heat storage?

Silica gel and zeolite are widely studied and applied as common adsorbents using water as working fluid. Some new classes of materials, including aluminophosphates (AlPOs), silico-aluminophosphates (SAPOs) and metal-organic frameworks (MOFs), have recently emerged as promising porous materials for heat storage, as shown in Fig. 3.

Do microporous aluminophosphates perform well in low-temperature solar energy storage?

The performance of small-pore microporous aluminophosphates in low-temperature solar energy storage: the structure-property relationship. *Adv. Funct. Mater.* 22, 1952-1957 (2012). Krajnc, A. et al. Superior performance of microporous aluminophosphate with LTA topology in solar-energy storage and heat reallocation.

Which thermochemical materials are most promising for seasonal heat storage?

MgCl<sub>2</sub> was identified by Zondag et al. from ECN (Energy Research Centre of the Netherlands) as the most promising of the tested materials for seasonal heat storage, after testing a list of thermochemical materials including MgSO<sub>4</sub>, Al<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>, MgCl<sub>2</sub> and CaCl<sub>2</sub>.

Can silica gel be used in closed sorption thermal storage systems?

It seems that using silica gel in closed sorption thermal storage systems is not sufficiently competitive for short-term applications, due to its low energy density. However, when it comes to longer periods, silica gel still possesses the heat storage ability in some extent and its energy density could be higher than sensible storage of water.

Can porous solids be used for sorption thermal energy storage?

Booming progress is reported in the materials science in recent decades, offering a huge choice of novel porous solids which may be used for sorption thermal energy storage.

What are the characteristics of sorption thermal storage materials?

The characteristics of storage materials--especially the energy density--are prerequisite to obtaining compact and efficient sorption thermal storage applications. Energy density is defined as the amount of energy stored in a given system or region of space per unit volume or per unit mass.

The water vapor and the silico-alumino-phosphate (SAPO-34) material has been recognized to be one of the better adsorbate-adsorbent pairs for the packed-bed adsorptive thermal energy storage (TES) systems for space heating applications. In this paper, operating conditions including the system construction materials selection, cooling methods of the ...

The present work aims at a more systematic computational exploration of the influence of various structural factors (pore size, pore topology, environment of framework protons) on the ...

SAPO-34 - a silicoaluminophosphate microporous material - has recently attracted a great attention in the field of sorption thermal storage, since it is characterized by good water adsorption behavior (i.e. type V adsorption isotherms) and low regeneration temperature (i.e. 80 °C, for instance available by standard solar thermal energy collectors).

adsorption energy storage and transformation[9]. Due to the isomorphous substitution of Si atoms into the AlPO framework, SAPO molecular sieves hold medium-strength acidity, which are desired industrial catalysts candidates. SAPO-34 is well-known as the methanol to olefins(MTO) catalyst, which has taken the lead in realizing industrial

Recently, a small-pore aluminophosphate AlPO-LTA was also reported as a promising candidate for water-sorption-based heat pump and thermal energy storage [38]. Moreover, aluminophosphates deliver ...

A resume of the main adsorbent materials used in thermochemical heat storage is available in [3], and from this we can list SG, Z (natural, 4A, 5A, 10X, 13X), aluminophosphate, silico ...

TCES is therefore a potential technology for seasonal energy storage, and theoretically allows for 100 % of required thermal energy to be generated using renewables. As well as this it offers the highest energy storage density (by mass and by volume) of any thermal energy storage technology [11]. However, the field is still in its infancy with ...

REVIEW published: 07 May 2019 doi: 10.3389/fmats.2019.00106 Silico-Aluminophosphate and Alkali-Aluminosilicate Geopolymers: A Comparative Review Yan-Shuai Wang, Yazan Alrefaei and Jian-Guo Dai\* Department of Civil and Environmental Engineering, The Hong Kong Polytechnic University, Hong Kong, Hong Kong Edited by: Miroslav Komljenovic, University of Belgrade, ...

Thermodynamic cycle of a seasonal solar energy storage plant adopting LiBr/H<sub>2</sub>O working pair [13]. See text for details. ... natural rock, and novel porous solids, such as aluminophosphate (AlPO), silico-aluminophosphate (SAPO), and ...

Seasonal thermal energy storage (TES) has been utilized to mitigate this mismatch by storing excessive solar energy in summer and releasing it for space and water heating in winter when needed [9] ...

Chemically activated materials (often termed as geopolymer) have received attracting attentions in civil, material and environmental research fields as a toolkit alternative to traditional Portland cement in specific applications. This paper presents a state-of-the-art review on silico-aluminophosphate (SAP) geopolymers in terms of definition, chemistries involved during ...

Silico-aluminophosphate (SAP) geopolymers were synthesized by using metakaolin (MK) and a high content of fly ash (FA) for the first time. With the increase in the FA mass fraction in the raw materials from 50% to 100%, the setting time of the SAP geopolymers was shortened and their compressive strength was decreased.

This work was supported by the National Natural Science Foundation of China (Nos.21991090, 21991091, 22171259) and the Innovation Research Foundation of Dalian Institute of Chemical Physics, Chinese Academy of Sciences(No.DICP I201909).

The built environment accounts for a large proportion of worldwide energy consumption, and consequently, CO<sub>2</sub> emissions. For instance, the building sector accounts for ~40% of the energy consumption and 36%-38% of CO<sub>2</sub> emissions in both Europe and America [1, 2].Space heating and domestic hot water demands in the built environment contribute to ...

Request PDF | Superior Performance of Microporous Aluminophosphate with LTA Topology in Solar-Energy Storage and Heat Reallocation | Hydrophilic porous materials are recognized as very promising ...

Research progress of seasonal thermal energy storage technology based on supercooled phase change materials. Weisan Hua, ... Jiahao Zhu, in Journal of Energy Storage, 2023. 2 Types of seasonal thermal energy storage. Seasonal thermal energy storage is an effective way to improve the comprehensive energy utilization rate. Solar energy and natural cold heat can be efficiently ...

The long-term or seasonal heat storage in regions with moderately cold winter (South Russia, Europe and central part of North America), and for short-term or daily heat storage in winter in regions, where the solar thermal energy during day time can be stored, and then used for heating at night (South-West and South-East Asia, North Africa and ...

In the current era, national and international energy strategies are increasingly focused on promoting the adoption of clean and sustainable energy sources. In this perspective, thermal energy storage (TES) is essential in developing sustainable energy systems. Researchers examined thermochemical heat storage because of its benefits over sensible and latent heat ...

Linde type A (LTA) aluminophosphate is a promising candidate for an energy storage material used for low-temperature solar and waste-heat management. The mechanism of reversible water adsorption, which is the basis for potential industrial applications, is still not clear. In this paper, we provide mechanistic insight into various aspects of the hydration process ...

In this study, a porous, zeolite-like aluminophosphate with LTA topology is inspected as an energy-storage material. The study is motivated by the material's high predicted pore volume.

silico-aluminophosphate. MOF. metalorganic framework. COP. coefficient of performance. ENG-TSA. expanded natural graphite treated with sulfuric acid. CEM. ... was better than that with oil-only. Gravel-water mixture used for seasonal solar energy storage, which also belonged to hybrid SHTES materials, had been presented by Schmidt et al. [178 ...

4 69 aluminum [16], as is also observed in the synthesis of charge-neutral crystalline zeolite-like 70 aluminophosphate and silico-alumino-phosphate frameworks [17]. Thus, a charge balance 71 within the molecular structure is achieved without the involvement of monovalent cations. The 72 above mechanisms create a silico-aluminophosphate geopolymer with low efflorescence and

A silico-aluminophosphate (SAPO) with a CHA-type structure (very similar to FAM-Z02) exhibits a higher amount of water uptake than aluminophosphates with an AFI-type structure (very similar to FAM-Z01), and the larger water uptake was explained by the larger surface area of the CHA-type sample. ... and thermal energy storage systems. Ultralow ...

The mechanistic insights into silico-aluminophosphate (SAP) geopolymer formation remain an enigma. Here, we aim to elucidate this process and improve the early-age performance of SAP geopolymers by utilizing incinerated sewage sludge ash (ISSA). ... (AAMs) due to the lower production energy of phosphate activators [6]. Therefore, the ...

where  $n$  is the degree of geopolymerization,  $z$  is 1, 2, or 3, and  $M$  is an alkali cation (e.g., K or Na).. Recently, the term "chemically-activated materials" (CAMs) was also proposed to describe the aluminosilicate sources that can be activated to create cementitious matrices using some chemical solutions (e.g., alkali-silicate, phosphate and other chemicals) (CAM2017 ...

Silico-Aluminophosphate and Alkali-Aluminosilicate Geopolymers: A Comparative Review ... that may cause undesirable high cost and energy consumption, the MK is still confined to laboratory use with the aim of investigating the mechanism of geopolymer formation (Khale and Chaudhary, 2007); however, the use of MK is recommended ...

The concept of long-term energy storage or seasonal energy storage has become a fairly hot research topic in recent decades [3], [6], [55]. Conventional storage methods can be sorted as short-term storage since heat input and output occur within an interval of several hours or days. ... Silico-aluminophosphate type 34: Experimental, TG/DSC ...
