

Single Microgrid Structure

What are the different types of microgrid architectures?

There are various microgrid architectures: single-bus microgrid, multibus microgrid, multiterminal microgrid, ring-bus microgrid, ladder-bus microgrid, and zonal microgrid. The single-bus microgrid structure has a single bus. Energy sources, loads, and energy storage devices are connected to this bus directly or via power electronic circuits.

What is Microgrid technology?

It is a small-scale power system with distributed energy resources. To realize the distributed generation potential, adopting a system where the associated loads and generation are considered as a subsystem or a microgrid is essential. In this article, a literature review is made on microgrid technology.

Why is microgrid important in Smart Grid development?

Microgrid is an important and necessary component of smart grid development. It is a small-scale power system with distributed energy resources. To realize the distributed generation potential, adopting a system where the associated loads and generation are considered as a subsystem or a microgrid is essential.

How can a microgrid be controlled from a single center?

By collecting these data, different parameters of the microgrid such as the renewable energy generation, the battery charge status, the grid electricity prices, the controllable load information, the energy management of the microgrid, and the power exchange with the grid can be controlled from a single center.

How are microgrids categorized?

Microgrids can be categorized via different aspects ranging from the structure such as DC, AC, or hybrid to control scheme such as centralized, decentralized or distributed. This chapter reviews briefly the microgrid concept, its working definitions and classifications.

What are the components of microgrid control?

The microgrid control consists of: (a) micro source and load controllers, (b) microgrid system central controller, and (c) distribution management system. The function of microgrid control is of three sections: (a) the upstream network interface, (b) microgrid control, and (c) protection, local control.
