TES systems are divided into two categories: low temperature energy storage (LTES) system and high temperature energy storage (HTES) system, based on the operating temperature of the energy storage material in relation to the ambient temperature [17, 23]. LTES is made up of two components: aquiferous low-temperature TES (ALTES) and cryogenic ...

Sensible thermal energy storage is a well-proven storage technique which has been employed long time ago in various thermal applications where water, rock and soil are common storage mediums [11]. Such systems are cheap and simple and rely on the storage material specific heat capacity through increasing the temperature without changing the ...

The mathematical model of soil heat storage system is established, and the similarity function relationship of soil heat storage system is deduced based on the similarity theory, in the authors' research work [52] to investigate the cold energy storage potential in the regions under typical weather conditions. Soil Carbon Storage Is Derived from Root Carbon Inputs Field studies clarify the role of roots in soil carbon storage To a large degree, the sources and stability of soil organic carbon remain poorly constrained. A clear understanding of links among the components of the soil C cycle is hampered by the complexity of the [...]

More roots reaching deep soil layers could result in more carbon being sequestered, or roots may unlock older carbon in deep soils. By combining advanced imaging techniques, this study examined how root activity impacts ...
