

The Sun. Our solar system is in the Milky Way galaxy and located in an outer spiral arm. This is where we call "home." The solar system is made up of some major and minor players, all of which interact with each other.

The Nine Planets is an encyclopedic overview with facts and information about mythology and current scientific knowledge of the planets, moons, and other objects in our solar system and beyond.

While astronomers have discovered thousands of other worlds orbiting distant stars, our best knowledge about planets, moons, and life comes from one place. The Solar System provides the only known example of a habitable planet, the only star we can observe close-up, and the only worlds we can visit with space probes. Solar System research is essential for understanding ...

Introduction. This seemingly simple question doesn't have a simple answer. Everyone knows that Earth, Mars and Jupiter are planets. But both Pluto and Ceres were once considered planets until new discoveries triggered scientific debate about how to best describe them--a vigorous debate that continues to this day. The most recent definition of a planet was adopted by the ...

What is the Definition of a Planet? There is an ongoing debate about the number of planets in our solar system. The most recent definition of a planet was released in 2006 by the International Astronomical Union (), an organization ...

Learn about the sun and the planets, dwarf planets, moons, asteroids, comets, and other objects that orbit our star. Discover how the solar system formed, what it's made of, and how it compares to other star systems.

The Oort Cloud is considered to mark the edge of the solar system as, beyond that the gravity of the stars begin to dominate that of the sun, says NASA. The inner boundary of the main region of the ...

34. Did you know that Uranus is the only planet in our solar system whose equator is nearly at a right angle to its orbit (a tilt of 97.77 degrees)? It also means that for about one-quarter of a Uranus year, the sun shines on one pole at a time.

The Sun. The Sun is the source of light and energy in the solar system. This yellow dwarf star is a big ball of glowing gases made up of hydrogen and helium. The Sun's gravity holds the solar system together. It generates energy through nuclear fusion, and without it, life and everything that we know will not exist. Learn more about the Sun

A star that hosts planets orbiting around it is called a planetary system, or a stellar system, if more than two

Solar sytem

stars are present. Our planetary system is called the Solar System, referencing the name of our Sun, and it hosts eight planets.. The eight planets in our Solar System, in order from the Sun, are the four terrestrial planets Mercury, Venus, Earth, and ...

The Solar system is a great place for kids to start learning about the universe. But reading about it can be overwhelming. There is so much information about the Solar system for kids but a lot of it is written using advanced terms and doesn't completely answer their questions.

Planet Facts - The Planets In Order. Our solar system has eight planets: Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus and Neptune. With the exception of Uranus and Neptune, each of these planets can be seen unaided.

This is a simple guide to the sizes of planets based on the equatorial diameter - or width - at the equator of each planet. Each planet's width is compared to Earth's equatorial diameter, which is about 7,926 miles (12,756 kilometers).

The Sun. The Sun is the source of light and energy in the solar system. This yellow dwarf star is a big ball of glowing gases made up of hydrogen and helium. The Sun's gravity holds the solar system together. It generates energy ...

Learn about the Sun, planets, dwarf planets, moons, asteroids, and comets that make up our solar system. Find out how it formed, how big it is, and how it compares to other star systems.

The solar system consists of the Sun; the eight official planets, at least three "dwarf planets", more than 130 satellites of the planets, a large number of small bodies (the comets and asteroids), and the interplanetary medium.

What is the Definition of a Planet? There is an ongoing debate about the number of planets in our solar system. The most recent definition of a planet was released in 2006 by the International Astronomical Union (), an organization responsible for classifying astronomical objects.. Their definition requires a planet to:
