

# Space solar power institute

What is space solar power?

Space solar power provides a way to tap into the practically unlimited supply of solar energy in outer space, where the energy is constantly available without being subjected to the cycles of day and night, seasons, and cloud cover--potentially yielding eight times more power than solar panels at any location on Earth's surface.

Can solar power power the International Space Station?

“Solar panels already are used in space to power the International Space Station, for example, but to launch and deploy large enough arrays to provide power to Earth, SSPP has to design and create solar power energy transfer systems that are ultra-lightweight, cheap, and flexible.”

Can space solar power beam power to Earth?

A space solar power prototype that was launched into orbit in January is operational and has demonstrated its ability to wirelessly transmit power in space and to beam detectable power to Earth for the first time.

How does space solar power work?

Here's how it works. A space solar power prototype has demonstrated its ability to wirelessly beam power through space and direct a detectable amount of energy toward Earth for the first time. The experiment proves the viability of tapping into a near-limitless supply of power in the form of energy from the sun from space.

Will SSPD-1 help chart the future of space solar power?

Now, with SSPD-1's mission in space concluded, engineers on Earth are celebrating the testbed's successes and learning important lessons that will help chart the future of space solar power. “Solar power beamed from space at commercial rates, lighting the globe, is still a future prospect.

What is space-based solar power?

The idea of space-based solar power dates back to as early as 1923 when Russian theorist Konstantin Tsiolkovsky proposed using mirrors in space to concentrate a strong beam of sunlight down to Earth.

California Institute of Technology's (Caltech's) first space-borne prototype launched into orbit has demonstrated the ability to wirelessly transmit power in space and beam detectable power to ...

Two Korean research institutes are designing the 2.2 km  $\times$  2.7 km Korean Space Solar Power Satellite project with the aim of providing approximately 1 TWh of electricity to the Earth per year. The ...

Space-based solar power is having a first test: a satellite experiment by the California Institute of Technology, launched on a SpaceX Falcon 9 rocket to transmit photovoltaic electricity by ...

This paper presents the results of research conducted in Korea on the development and implementation of Space Solar Power Satellites (SSPS). ... field, research is being carried out at Korea Electrotechnology Research Institute (KERI) under a long-term project (2017-2025, \$11,000,000) as a BIG Issue Group project granted by NST. The first ...

Today, Caltech is announcing that Donald Bren, chairman of Irvine Company and a lifetime member of the Caltech Board of Trustees, donated over \$100 million to form the Space-based Solar Power Project (SSPP), which is developing technology capable of generating solar power in space and beaming it back to Earth.. The donation was made anonymously in 2013, ...

Space Based Solar Power offers a range of characteristics which could help the UK deliver Net Zero, with a new source of abundant, sustainable power. SBSP is the concept of harvesting free solar energy in space, beamed to Earth safely as microwaves, collected and converted to electricity for the Grid, each one equivalent in output to a large ...

We provide an update on the Caltech Space Solar Power Project (SSPP). Our space power station employs a "sandwich" architecture where solar energy is collected on one side of a plate and coherent ...

The idea of harvesting the sun's energy and beaming it back to earth as space-based solar power (SBSP) was originally conceived in a science fiction story by Isaac Asimov in 1941. Today, this ambitious concept is no longer fiction but being developed by universities and start-ups with early government backing in the UK, US, Japan, India and China. New Energy ...

47 Proposed is the "Caltech Space Solar Power System," a system 48 composed of 1) a PV-to-RF power station in geostationary orbit 49 (GEO) and 2) a terrestrial ground station connected to the grid. 50 1.1 PV-to-RF Power Station 51 The power station (PS) operates at three levels of hierarchy. The

SSPD-1 is the first spaceborne prototype from Caltech's Space Solar Power Project (SSPP). [Caltech story] On a cool, clear evening in May 2023, Caltech electrical engineer Ali Hajimiri and four members of his lab ...

SSPP aims to develop a PV cell with an efficiency level of 25 percent that is 100 times less expensive (\$100 per square meter), 40 times lighter (0.05 kilograms per square meter), and with a specific power 33 times greater ...

However, recent advances in photovoltaics, structures, electronics, and lower launch costs could make space solar power a reality in the near future. May 2013. Donald Bren, chairman of the Irvine Company and life member of the Caltech ...

The illustration below by Space Studies Institute Senior Associate Mark Martel shows the construction of an SSI-design solar power satellite built of lunar materials in geosynchronous orbit, where there is permanent sunshine. ... had ...

# Space solar power institute

One year ago, Caltech's Space Solar Power Demonstrator (SSPD-1) launched into space to demonstrate and test three technological innovations that are among those necessary to make space solar power a reality. The spaceborne testbed demonstrated the ability to beam power wirelessly in space; it measured the efficiency, durability, and function of a variety of different ...

California Institute of Technology. "Space solar power project ends first in-space mission with successes and lessons." ScienceDaily. / releases / 2024 / 01 / 240117143613.htm ...

The signal--if it came--would arrive in the form of a weak microwave beam transmitted from the Space Solar Power Demonstrator (SSPD-1), a 110-pound set of Caltech payloads that had launched into space five months earlier aboard a SpaceX rocket on the Momentus Vigoride-5 spacecraft. SSPD-1 is the first spaceborne prototype from Caltech's

Two Korean research institutes are designing the 2.2 km  $\times$  2.7 km Korean Space Solar Power Satellite project with the aim of providing approximately 1 TWh of electricity to the Earth per year. The proposed system ...

For more news about space solar, keep an eye on the goings-on over at the California Institute of Technology, which put a space solar prototype into orbit last year. Follow me @tinamcasey on ...

Intrigued by the potential for space solar power, Bren approached Caltech's then-president Jean-Lou Chameau in 2011 to discuss the creation of a space-based solar power research project. ... The Institute responded by asking Hajimiri, Pellegrino, and Atwater's teams to invent the necessary new technologies, materials, and manufacturing ...

America needs a strong national commitment to Space Solar Power and a directed Space Solar Power research and development program. We must leverage the full array of governmental and private resources to produce a full-scale demonstration of Space Solar Power. Such a demonstration should provide a pathway for an economically sustainable ...

Technology capable of collecting solar power in space and beaming it to Earth to provide a global supply of clean and affordable energy was once considered science fiction. Now it is moving closer to reality. Through the Space-based Solar Power Project (SSPP), a team of California Institute of Techn

SSPD-1 was launched in January 2023 as part of the California Institute of Technology's (Caltech) Space Solar Power Project (SSPP), the primary goal of which is to harvest solar power in space and ...

Now, with SSPD-1's mission in space concluded, engineers on Earth are celebrating the testbed's successes and learning important lessons that will help chart the future of space solar power. "Solar power beamed from ...

One year ago, Caltech's Space Solar Power Demonstrator (SSPD-1) launched into space to demonstrate and test three technological innovations that are among those necessary to make space solar power ...

Two Korean research institutes are designing the 2.2 km &#215; 2.7 km Korean Space Solar Power Satellite project with the aim of providing approximately 1 TWh of electricity to the Earth per year. The proposed system should use 4,000 sub-solar arrays of 10 m &#215; 270 m, made out of thin film roll-out, with a system power efficiency of 13.5%.

The illustration below by Space Studies Institute Senior Associate Mark Martel shows the construction of an SSI-design solar power satellite built of lunar materials in geosynchronous orbit, where there is permanent sunshine. ... had been directly involved with Solar Power Satellites / Space Based Solar Power since before it was even conceived ...
