What is included in a standard steam turbine generator set?

We deliver a standard steam turbine generator set including the SST-600 (with or without gearbox), a generator, oil system, piping and instrumentation and the control system. The standard package can be extended to include a condenser, condensing plant or pre-heating system.

What is a modular steam turbine generator?

Flexible, modular steam turbine generator design provides solutions for best-in-class reliability and efficiency. Our steam turbines are complete high-efficiency solutions for industrial processes and oil and gas power output applications--responding to energy demand with best-in-class plant efficiency and low total cost of ownership.

When was the first steam turbine discovered?

In 1884, the first steam turbine was discovered by Sir Charles A. Parsons. Steam turbines are most commonly used to generate electricity in thermal power plants, as well as in various industrial applications that need mechanical power. In this turbine, the mechanical work generates with the help of the turbine shaft.

What is a steam turbine?

Steam turbines are designed for a wide range of power outputs, from small-scale applications to large-scale power plants generating hundreds or thousands of megawatts. They have long operational life and high reliability. They have the capability to use different fuel sources for steam generation. They are environmental friendly.

How many combined-cycle steam turbines are there?

Right now there are more than 1,000 combined-cycle steam turbines operating in 70+ countries, generating more than 140 GW of power. Our steam turbines can be installed and operational in eight months or less for industry-leading commissioning. Our robust, reliable steam turbines are enhanced by control systems and the power of GE Digital solutions.

How does a power plant LP turbine work?

Typical Power Plant LP Turbine Casing and Double Flow Rotor A typical power plant steam turbine will have steam entering the HP turbine at 180 bar (2610 psi), 5400C (1,0000F). Steam from the HP turbine is then returned to the boiler where it is reheated to 5400C (1,0000F) at approximately 45 bar (652 psi).

We install rotors, bearings, standards all internal components, condenser expansion joints, casings, turning gears, piping for auxiliaries, and steam seal systems. We also conduct hydro ...
