

# Technical Specifications for Microgrid Access to Distribution Network

What are the International microgrid standards?

Thus, many international microgrid standards are still being developed, several standards are on-going drafting by IEEE and IEC organization, such as self-regulation of dispatchable loads, monitoring and control systems, energy management systems and use case design.

Why do we need a standard system for microgrids and distributed energy resources?

The prosperity of microgrids and distributed energy resources (DER) promotes the standardization of multiple technologies. A sound and applicable standard system will facilitate the development of renewable energy and provide great guiding significance for technology globalization.

How many distributed generation and microgrid standards are there?

In this review, the state of the art of 23 distributed generation and microgrid standards has been analyzed. Among these standards, 18 correspond mainly to distributed generation while five of them introduce the concept of microgrid.

What are the technical specifications for EES in microgrids?

Detailed technical specifications for EES in microgrids should be addressed considering the operating characteristics of various EES types, to meet diversified demands of modern microgrids. In general, EES can work as load when charging and as generator when discharging.

What is a microgrid analysis?

These analyses include the microgrid type classification and application scenario, interaction capability between microgrid and distribution network, operation and control of energy storage system, and protection and stability requirements.

Are energy storage devices regulated in a microgrid?

For instance, in the first microgrid standard IEEE 1547.4, the electrical energy storage (EES) is solely regarded as a type of DER to be regulated without specific technical requirements. However, energy storage devices have gradually become a critical part of microgrid in terms of planning and operation stages [42,43].
