

The principle of photovoltaic inverter

What is a solar inverter?

A solar inverter or photovoltaic (PV) inverter is a type of power inverter which converts the variable direct current (DC) output of a photovoltaic solar panel into a utility frequency alternating current (AC) that can be fed into a commercial electrical grid or used by a local, off-grid electrical network.

How a solar inverter works?

The working principle of the inverter is to use the power from a DC Source such as the solar panel and convert it into AC power. The generated power range will be from 250 V to 600 V. This conversion process can be done with the help of a set of IGBTs (Insulated Gate Bipolar Transistors).

What type of electricity does a solar inverter use?

However, the majority of homes and businesses use alternating current (AC) electricity, which is better suited for long-distance power transmission and compatibility with most electrical appliances. Solar inverters are used to convert the DC electricity from solar panels into AC electricity that can be used directly or fed into the electrical grid.

Can a solar power inverter convert DC to AC?

However, the newly created DC is not safe to use in the home until it passes through an inverter which turns it from DC to AC. There are four main types of solar power inverters: Also known as a central inverter. Smaller solar arrays may use a standard string inverter.

Do I need a solar inverter?

However, your home operates using alternating current (AC or "household") electricity. A solar inverter converts DC to AC electricity. Depending on your system, a storage inverter or power optimiser may also be required. In short, you can't have a residential or portable solar power system without at least one solar inverter.

How to clean a solar inverter?

The best way to clean the solar panels is by using a pipe & a bucket of soapy water. Thus, this is all about the working of solar inverter. It is an electrical device, used to convert DC to AC where DC is generated from a solar panel.
