What is thermal energy storage?

Thermal energy storage means heating or cooling a medium to use the energy when needed later. In its simplest form, this could mean using a water tank for heat storage, where the water is heated at times when there is a lot of energy, and the energy is then stored in the water for use when energy is less plentiful.

How does thermal energy work?

The energy, in the form of hot or chilled water, can then be distributed to buildings via a pipe network for immediate use or be stored in thermal storages for later use. The thermal energy can be stored for a few hours or days, for example in heat storage tanks, or for several months in large pits or other storage facilities.

How does a thermal energy storage tank work?

Thermal energy storage tanks store chilled water during off-peak hours when energy rates are lower. This water cools buildings and facilities during peak hours, effectively reducing overall electricity consumption by shifting the cooling system's power usage from daytime to nighttime.

How many gallons does a thermal energy storage tank store?

The liquid storage for these tanks can be between tens of thousands and millions of gallons, depending on the system's needs. Thermal energy storage tanks store chilled water during off-peak hours when energy rates are lower.

What are the different types of thermal energy storage systems?

Thermal energy storage (TES) systems store heat or cold for later use and are classified into sensible heat storage, latent heat storage, and thermochemical heat storage. Sensible heat storage systems raise the temperature of a material to store heat. Latent heat storage systems use PCMs to store heat through melting or solidifying.

What are the benefits of thermal energy storage?

Advances in thermal energy storage would lead to increased energy savings, higher performing and more affordable heat pumps, flexibility for shedding and shifting building loads, and improved thermal comfort of occupants.

How Thermal Energy Storage Works. Thermal energy storage is like a battery for a building's air-conditioning system. It uses standard cooling equipment, plus an energy storage tank to shift all or a portion of a building's cooling needs to off-peak, night time hours. During off-peak hours, ice is made and stored inside IceBank energy storage tanks.

Thermal Energy Storage Tank produces and stores the thermal energy in the form of chilled water during off-peak hour. During peak hour, the chilled water is pumped from the bottom of the storage tank and distributed to the facility, whilst the warmer water enters from the top of the tank hence smoothing out the energy consumption of the chiller system.

The thermal energy storage tank shifts two megawatts of load from peak to off-peak hours. This reduces about 40% of the peak demand for cooling, equaling a savings of about \$320,000 every year.
