Does heat pipe assisted thermoelectric generator work for automobile exhaust waste heat recovery?

Nevertheless, constructing a new type of heat pipe assisted thermoelectric generator (HP-TEG) for automobile exhaust waste heat recovery, and after applying a prototype, the experimental results indicated that the power output of HP-TEG favored high exhaust temperature, cold water flow rate and mass flow rate.

What is a low temperature waste heat recovery system (WHP)?

Lower-temperature waste heat can be recovered from thermal systems and processes and converted to electricity using other technologies, such as the organic Rankine cycle coupled with turbines or reciprocating engines. This WHP configuration is also referred to as "bottoming cycle" CHP.

How to increase waste heat recovery from internal combustion engine cooling system?

Low-temperature Rankine cycle to increase waste heat recovery from the internal combustion engine cooling system. - By the application of the thermodynamic analysis to 19 different working fluids, Ammonia had the highest compatibility with the proposed system.

How does a heat recovery steam generator work?

Many highly efficient industrial plants with cogeneration or combined cycle systems use a gas-turbine (essentially a jet engine) to generate electricity then create steam from the waste heat using a heat recovery steam generator (HRSG). This section will explain how this process works and how an HRSG comes into action.

How does waste heat to power work?

Waste heat to power (WHP) technologies produce electricity by capturing waste heat--typically from exhaust gas or industrial processes--and converting this waste heat to electricity. WHP systems utilize otherwise wasted thermal energy to drive turbines or engines that can produce electricity for on-site consumption or grid export.

Can a waste heat boiler recover heat from high temperature exhaust gases?

On the other hand, it was explored that waste heat boilers are suitable to recover heat from medium - high temperature exhaust gases and are mainly used to generate steam for power generation or energy recovery. Systems such as air preheaters were found to be useful for exhaust-to-air heat recovery and for low to medium temperature applications.
