

What is planet next to moon tonight

Will the Moon & Venus meet on November 4?

On November 4, the 9%-illuminated Moon and Venus (mag -4.0) will meet in the constellation Ophiuchus. The planet will be visible after sunset without any optical aid. As the event will occur three days after the New Moon, the lunar disc will be barely visible.

When will the Moon & Mars meet?

On November 20, the 77%-illuminated Moon and Mars (mag 0.2) will meet in the constellation Cancer. The planet will rise in the evening and will be visible to the naked eye. *The percentage of Moon illumination is for London. To find out the Moon illumination percentage for your location, check the lunar calendar.

Which supermoon is highest in the sky in 2024?

A full moon rises opposite the sunset, is highest in the sky at midnight and lies low on the western horizon opposite the sunrise. This is the third of four supermoons in a row. And it's the Hunter's Moon, plus it's the closest - largest and brightest - supermoon in 2024.

Which planets will be visible on November 17 & 20?

On November 17, the 98%-illuminated Moon and Jupiter (mag -2.8) will meet in the constellation Taurus. The planet will rise in the evening and will be visible to the naked eye. On November 20, the 77%-illuminated Moon and Mars (mag 0.2) will meet in the constellation Cancer. The planet will rise in the evening and will be visible to the naked eye.

How do I view planets and stars near our natural satellite?

To view the planets and stars near our natural satellite, choose a cloudless night and use Star Walk 2 or Sky Tonight to learn when the celestial objects are best placed for your location. For a visual explanation, watch our recently released video on how to identify bright objects near the Moon using the Sky Tonight app, step by step.

Is a bright object near the Moon a star or a planet?

A bright object near the Moon can be a star or a planet. You can tell the difference by checking if the object twinkles. If it does, then it's a star; if not, it's a planet. Also, Jupiter and Venus (sometimes Mars and Saturn, too) are way brighter than most stars.
