Will solar power grow in 2050?

Solar will grow from 3% of the U.S. electricity supply today to 40% by 2035 and 45% by 2050. In 2050, this would be supplied by about 1600 gigawatts alternating current (GWAC) of solar capacity. Solar will provide 30% of buildings' energy, 14% of transportation energy, and 8% of industrial energy by 2050, through electrification of these sectors.

Energy storage, long distance transmission, flexible renewable generators, and strategic solar and wind curtailment are all important tools in this transition.

Will solar power the future of Transportation?

The Solar Futures Study finds that solar energy could power about 14% of transportation end uses by 2050. Solar PV couples well to electric vehicle (EV) charging: Both use direct-current electricity, which avoids efficiency losses in conversion to alternating-current electricity--as much as 26% lost, in some cases.

Solar panels, also known as photovoltaics, capture energy from sunlight, while solar thermal systems use the heat from solar radiation for heating, cooling, and large-scale electrical generation. Let's explore these mechanisms, delve into solar's broad range of applications, and examine how the industry has grown in recent years.
