

What planet is out right now

Which planets are currently visible?

See which planets are currently visible, along with their rise and set times, to help you plan your observations. Jupiter presents a captivating view with its prominent cloud bands, the iconic Great Red Spot, and up to four of its largest moons: Io, Europa, Ganymede, and Callisto.

Will Uranus be visible in November 2024?

Uranus will be visible very close to the full moon on the evening of November 15, 2024. Uranus will be brightest and visible almost all night in our sky in November 2024 as it will reach its opposition on November 17, 2024. At that time, Uranus will be located on the opposite side of the sun on our sky's dome.

Where can I find a detailed view of a planet?

See the indispensable Observer's Handbook, from the Royal Astronomical Society of Canada. Visit Stellarium-Web.org for precise views from your location. Almanac: Bright visible planets (rise and set times for your location). Visit TheSkyLive for precise views from your location.

Where is Jupiter visible in 2024?

Jupiter is visible high in the southern sky preceding sunrise on October 22, 2024. It is visible to the right of Mars. It rises around 3 hours after sunset. It is easily visible to the unaided eye. It is the brightest object in the morning sky (except for the moon).

When is Uranus visible?

Uranus is visible high in the southwestern sky preceding sunrise on October 22, 2024. It is visible to the right of Jupiter. It rises around a couple of hours after sunset. As Uranus shines at the edge of naked-eye visibility, it is hardly visible to the unaided eye unless you have clear eyesight and a very dark sky.

When can you see a planet with a magnitude of 6?

Note: Planets that shine with a magnitude up to +6 are visible to the naked eye under ideal conditions, i.e., when the sky is crystal clear and very dark. Also, the higher the number, the lower its visibility. Currently, Mercury is rapidly emerging from the sun's glare and will be visible in the evening twilight from the end of October.

Two Comets in October? Around mid-October, C/2023 A3 (Tsuchinshan-ATLAS) may be visible after sunset. Show Tsuchinshan-ATLAS on our Night Sky Map (below).; There were hopes that C/2024 S1 (ATLAS)--a Kreutz sungrazer--might become bright toward the end of October. However, the latest indications are discouraging.
