What is a diesel generator air intake & exhaust system?

The diesel generator air intake and exhaust system (DGAIES) provides the diesel engine with combustion air from the outside. The combustion air passes through a filter and silencer before being compressed by a turbocharger and cooled by the coolant system before entering the individual cylinders for combustion.

What is the intake system of a diesel generator set?

The intake system of the diesel generator set is equipped with dry air filter and air filter and air resistance indicator, with exhaust gas turbocharger, full intake and guaranteed performance.

Why do generator exhaust systems need to be properly designed?

Generator exhaust systems need to be properly designed to ensure correct engine performance and safe operation. System design has become more complex with the desire to keep emissions low, along with the desire to utilize the heat energy in the exhaust gas.

How to choose a diesel generator intake pipe?

Diesel intake pipes for diesel generator set should be avoided as far as possible and the number of bends should be reduced, or use a large arc transition. The inner diameter of the intake pipe should not be less than 200mm, and the inner wall of the pipe should be smooth without soldering slag particles.

Why does a diesel generator make a loud noise?

(3) A leak in the intake and exhaust system of a diesel generator makes additional noise (usually a very sharp whistle). In order to provide enough fresh air for diesel generator set operation, diesel engine intake should be arranged in the air circulation place outside the engine room.

Do generators need ventilation?

Here are some facts and considerations you should know: Generators require ample amounts of air to cool and support the engine combustion process by expelling heat generated during operation. While proper ventilation factors in considerations of air movement; it directly impacts the effectiveness of heat removal from within the room.

Properly positioned exhaust fans ensure that the cool air brought in by the intake fans is fully utilized to cool down internal components before being expelled. Key Differences Between Exhaust and Intake Fans. ...
