What is the future of solar energy?

The Future of Solar Energy considers only the two widely recognized classes of technologies for converting solar energy into electricity -- photovoltaics (PV) and concentrated solar power (CSP), sometimes called solar thermal) -- in their current and plausible future forms.

Is solar power over?

The most remarkable is that it is nowhere near over. Read more in our series on solar energy: To call solar power's rise exponential is not hyperbole, but a statement of fact. Installed solar capacity doubles roughly every three years, and so grows ten-fold each decade. Such sustained growth is seldom seen in anything that matters.

How long do solar panels last?

Based on recent estimates of panel lifetime, we assume that a solar panel lasts 30 years on average. Using BNEF data up to 2020, through a whole-model data upgrade, we update realised capacity factors for onshore, offshore, and solar technologies to the most recent values.

Are solar photovoltaics ready to power a sustainable future?

Nat. Energy 3,515-527 (2018). Victoria, M. et al. Solar photovoltaics is ready to power a sustainable future. Joule vol. 5 1041-1056 (Cell Press, 2021). Nemet, G. How solar energy became cheap: a model for low-carbon innovation. (Taylor & Francis, 2019). Rogers, E. Diffusion of Innovations. (Free Press, 2003). Farmer, J. D. & Lafond, F.

Can solar power drive the energy transition?

The reports show that solar is increasingly emerging as the technology of choice to drive the energy transition, thanks to its technical and financial maturity, modularity, flexibility, and potential for sector coupling. As a result, solar installations reached 920 GW in 2021, and are now venturing into the terawatt scale for the first time.

Will the solar boom pick up pace in the next two years?

The solar boom is expected to pick up pace in the next two years. Iberdrola, a leading European renewable energy company, planned to "more than double our global solar capacity to 10.6 gigawatts by the end of 2025", said Xabier Viteri Solaun, director of the sustainable energy business. Share of cumulative power capacity by technology (%)

With a single satellite in low-Earth orbit, power beaming will only be available for any location on Earth for a few minutes as the spacecraft passes from horizon to horizon.
