

Wind power generation guarantee measures

How many GW of wind energy is installed in the EU?

So far, more than 200 GW of wind energy has been installed in the EU, including 16 GW offshore. Those installations provided 16% of the EU's electricity generated in 2022. Most of the necessary equipment has been delivered by European manufacturers, which are also strong players at global level.

How can we maximise on excess wind energy?

There are a number of ways that we can maximise on excess wind energy: In order for homes and businesses to use cleaner, greener energy, more renewables - such as wind power and solar power - will need to be connected to the electricity grid.

What is the current situation in the European wind power sector?

The current situation in the European wind power sector requires immediate action by the Commission in close cooperation with the Member States and industry. So far, more than 200 GW of wind energy has been installed in the EU, including 16 GW offshore. Those installations provided 16% of the EU's electricity generated in 2022.

How should power grid enterprises and renewable power generation enterprises cooperate?

Power grid enterprises and renewable power generation enterprises should cooperate in preparing forecast reports for the output of renewable power, and on the basis of such reports, break down power generation plans and contracts by month, week, day, hour etc., and prioritize renewable energy generation?

Should you provide technical guarantees on energy and power outputs?

In this context, providing technical guarantees on energy and power outputs is a well-accepted approach, which preserves business privacy. This is also the standard industry practice for guarantees on wind turbines, PV plants or thermal power plants.

What are the new measures for the offshore sector?

New measures are also set out specifically for the offshore sector under the dedicated Communication. Member States are now aiming to install 111 GW of offshore renewable generation capacity by 2030 - nearly twice as much as the initial objective of at least 60 GW set out in the 2020 EU Offshore Renewable Energy Strategy.

The UK government's British energy security strategy sets ambitions for 50GW of offshore wind power generation - enough energy to power every home in the country - by 2030. However, as wind power can be ...

As global energy crises and climate change intensify, offshore wind energy, as a renewable energy source, is given more attention globally. The wind power generation system is fundamental in harnessing offshore wind

...

New renewable energy exploitation technologies in offshore structures are vital for future energy production systems. Offshore hybrid wind-wave power generation (HWWPG) ...

English translation of China's policy measures for resolving curtailment of hydro, wind and PV power generation. China Energy Portal: English translations of Chinese energy ...

The European Investment Bank (EIB) Board of Directors announced yesterday a EUR5bn counter-guarantee scheme for wind energy manufacturing. This is the EIB's key action in the EU Wind Power Package. ...

Wind Power Generation Process. A wind power generation system, or wind turbine, is comprised of components such as an electrical generator, power converter, blades, hub, nacelle, and tower. It converts the kinetic energy of ...

As a key measure of the Wind Power Package, it has set up a EUR5bn counter guarantee facility to boost wind supply chain investments. On 31 July the EIB activated the first tranche of its counter guarantee facility through ...

The "rated power" of a wind turbine, given in kilowatts (kW), is the power produced at a chosen wind speed. This speed is quite high - often 10 or 12 metres per second. Different turbines have different rated wind speeds, so don't just go ...
